

# Illustrated Guide to Some Hornworts, Liverworts and Mosses of Eastern Canada 

Robert R. Ireland
and
Gilda Bellolio-Trucco

Musées nationaux du Canada

Musée national des sciences naturelles

SYLLOGEUS is a publication of the National Museum of Natural Sciences, National Museums of Canada, designed to permit the rapid dissemination of information pertaining to those disciplines and educational functions for which the National Museum of Natural Sciences is responsible. In the interests of making information available quickly, normal pulishing procedures have been abbreviated.

Articles are published in English, in French, or in both languages, and the issues appear at irregular intervals. A complete list of the titles issued since the beginning of the series (1972) and individual copies of this number are available by mail from the National Museum of Natural Sciences, Ottawa, Canada. K1A 0M8

La collection SYLLOGEUS, publiée par le Musée national des sciences naturelles, Musées nationaux du Canada, a pour but de diffuser rapidement le résultat des travaux dans les domaines scientifique et éducatif qui sont sous la direction du Musée national des sciences naturelles. Pour assurer la prompte distribution de cette publication, on abregé les étapes de la rédaction.

Les articles sont publiés en français, en anglais ou dans les deux langues, et ils paraissent irrégulièrement. On peut obtenir par commande postale la liste des titres de tous les articles publiés depuis le debut de la collection (1972) et des copies individuelles de ce numéro, au Musée national des sciences naturelles, Ottawa, Canada. K1A 0M8

## ABSTRACT

An illustrated identification guide is presented for some of the common or distinctive bryophytes occurring in eastern Canada. Only superficial (25-50x) features are utilized for identification of the plants. Included in the guide are 2 hornworts, 79 liverworts and 154 mosses that occur from Newfoundland to southern Manitoba.

Information is given on the life cycle and structure of bryophytes, on collecting and preparing a reference collection, on identification and methods of study and on a few reference books that are available. Keys to the bryophytes are accompanied by illustrations of the superficial characters important for their recognition. The habitat and distribution are listed for each bryophyte. The guide concludes with an illustrated glossary and an index to the bryophytes.

RESUME

Le présent ouvrage est un guide d'identification illustré de certains bryophytes communs ou particuliers de l'est du Canada. Seules les caractéristiques superficielles (25-50x) sont retenues pour 1'identification. Le guide décrit 2 anthocéres, 79 hépatiques et 154 mousses qui poussent de Terre-Neuve jusqu'au sud de Manitoba.

Le guide décrit le cycle évolutif et la structure des bryophytes, montre comment constituer et préparer une collection de référence, comment identifier et étudier des spécimens, et mentionne quelques ouvrages spécialisés. Les clés des bryophytes sont accompagnées d'illustrations de leurs caractéristiques superficielles importantes. Le guide précise l'habitat et la distribution de chaque bryophyte et se termine par un glossaire illustré et un index.

## ACKNOWLEDGEMENTS

The usefulness of this guide is enhanced by the habit sketches and accompanying drawings of Gilda Bellolio-Trucco. I am grateful to Linda Ley who did the glossary and structure illustrations (Fig. 2) and helped in all aspects of this work, including the final typing of the manuscript. I appreciate the assistance of Paul Cohen, museum volunteer, and Yves Boudreau, COSEP student, both of whom tested the keys. I thank Eleanor Fenton and Bonnie Livingstone for their assistance with the publication of this guide. Dr. W.B. Schofield, University of British Columbia, read the manuscript and I am indebted to him for his useful comments. Finally, I thank Suzanne Chartrand for the French translation of the guide and Dr. M. Poulin and Miss Kathleen Pryer, National Museum of Natural Sciences, National Museums of Canada, for checking the translation.

The purpose of this guide is to acquaint the reader with some of the common or distinctive hornworts (Division Anthocerotophyta), liverworts (Division Hepatophyta) and mosses (Division Bryophyta) that occur in eastern Canada. These plants, collectively called bryophytes, are often abundant in many parts of the country, yet few people are familiar with their names or know how to distinguish one from another. Their small size makes many bryophytes appear alike to the untrained eye but even a casual glance at the illustrations in this guide reveals a vast array of different plants. In fact, there are approximately 550 species of mosses, 200 species of liverworts and 3 species of hornworts in eastern Canada. This guide contains 235 of the most conspicuous bryophytes found from Newfoundland to southern Manitoba, mainly below $50^{\circ} \mathrm{N}$ latitude.

The guide is intended primarily for the amateur naturalist or student botanist who would like to be able to recognize bryophytes using superficial characters. A dissecting microscope with a 25-50x magnification, available at most universities, is ideal for this purpose. In lieu of this, a $10-20 x$ hand-lens, which may be purchased at university bookstores, museum boutiques or biological supply stores, can be used with some success.

## LIFE CYCLE

In order to understand clearly the structure of the bryophytes it is necessary to describe their life cycle. The life cycle of most bryophytes follows a somewhat similar basic pattern, illustrated here using a moss as an example (Fig. 1).

The life cycle begins with the spore (Fig. 1: 1). There are generally hundreds to thousands produced by each plant. These small roundish structures, usually only a few micrometers in diameter, have walls that are either smooth or variously sculptured with a network of ridges and processes. After the spore lands in a favourable environment, germination begins and a green, filamentous protonema is produced (Fig. 1: 2). The protonema grows to produce a multicellular, branched web that may cover several centimeters
of substratum. There are some bryophytes that have a thalloid protonema instead of a filamentous one. The protonema forms rhizoids to anchor it to the substratum and eventually a small bud (Fig. 1: 3) develops which forms the leafy (Fig. 1: 4-5) or, in the case of the hornworts and some liverworts, the thalloid gametophyte. The gametophyte may be unisexual or bisexual and bear sexual buds or inflorescences (Fig. 1: 6) containing the male sex organs (Fig. 1: 6a), or antheridia (sing., antheridium), the female sex organs (Fig. 1: 6c), or archegonia (sing., archegonium), or both. Sterile, multicellular hairs, paraphyses (sing., paraphysis), are usually intermingled with the sex organs. Each antheridium contains numerous biflagellate sperm cells (Fig. 1: 6b) but there is only a single egg in each archegonium (Fig. 1: 6c). The sperm are released from the antheridia and swim in a film of water to the archegonia containing the egg (Fig. 1: 6c). The fusion of a sperm and an egg results in a progressive division of cells that eventually forms a sporophyte (Fig. 1: 7-13). The sporophyte of most bryophytes consists of a foot, deeply imbedded in the gametophyte to serve as an absorbing organ for water and food needed for its growth, a seta which is a slender stalk of varying length and, at the distal end of the seta, a capsule containing the spores. Frequently a membranous hood, or calyptra (Fig. 1: 11), which is a remnant of the archegonium, sheathes the capsule. In addition to the spores in the capsule, the liverworts have elaters and the hornworts have pseudoelaters, which are hygroscopically active, elongate cells functioning as aids for loosening up the spore mass and dispersing the spores.

Besides sexual reproduction, as described above, many bryophytes also reproduce by asexual or vegetative means. Specialized branches, parts of leaves, or almost any young cell of the bryophytes may have the capacity to produce a new gametophyte. Quite often, special reproductive bodies called gemae (sing., gemma) are produced in large numbers on the leaves, stems or rhizoids of the gametophyte. Each gemma, after becoming detached from the plant and landing in a favourable environment, is capable of forming a gametophyte and perhaps, eventually, a sporophyte through a series of stages similar to that of the sexually produced spore.

Gametophyte bearing mature sporophyte. 12. Detail of mature capsule before spore release. 13. Detail of capsule showing spore release.

## HORNWORTS (ANTHOCEROTOPHYTA)

All hornworts have a small (ca. 2 cm in diameter), flat, nearly circular, irregularly lobed, thallus or gametophyte (Fig. 2: 1). The thallus is dark green and translucent, each cell of which contains a single large chloroplast, in contrast to other bryophytes which have several chloroplasts per cell. Cavities in the gametophyte are sometimes occupied by colonies of the blue-green alga Nostoc and appear as dark spots on the surface of the thallus. The sex organs are not visible because they are sunken in the upper surface of the gametophyte. Unicellular rhizoids are located on the undersurface of the thallus. A long, cylindrical capsule (hence the name hornwort), sometimes up to 3 cm long, contains spores and pseudoelaters. The cylindrical capsule is green and arises from a bulbous base attached to the thallus. It is surrounded by a tubular outgrowth of the thallus called an involucre. The capsule, which is a long-lasting structure that persists until the death of the gametophyte, splits lengthwise at maturity into two valves to release the spores. A slender thread-1ike, central strand inside the capsule (columella) may also be seen when the valves split apart. Each capsule continues to produce new spores throughout the growing season, shedding them as they mature in the upper part of the capsule.

## THALLOID LIVERWORTS (HEPATOPHYTA)

The gametophyte of many thalloid liverworts is more complex than that of the other bryophytes (Fig. 2: 2). The thallus is light green to dark green, occasionally yellowish green, dull, translucent or with a greasy appearance, and the undersurface, especially the margins, is often purplish. The thalli are large, sometimes reaching $1-3 \mathrm{~cm}$ wide and $15-20$ cm long, flat and variously lobed. They are one (unistratose) to several (multistratose) layers thick. The upper surface often contains pores leading into air chambers and frequently there are diamond-shaped surface markings surrounding the pores. The lower surface of the thallus of ten bears unicellular rhizoids and sometimes small scales. A costa is present on the thalli of some species, while dark spots of Nostoc colonies are present on others. Minute green gemmae on the thalli margins or in cups or flask-shaped
receptacles on the surface may be present also in some species. The thalli may be unisexual or bisexual with the sex organs variously located on or in the upper or lower surface. Sometimes the antheridia and archegonia are borne on the dorsal surface in specialized stalked receptacles called antheridiophores and archegoniophores, respectively. The sporophyte is often inconspicuous because the capsule is on a short seta and frequently remains hidden in the archegoniophore or it may be entirely imbedded in the thallus. The capsule, containing spores and elaters, opens irregularly or splits into four valves at maturity.

## LEAFY LIVERWORTS (HEPATOPHYTA)

The leafy liverworts are much more common than the thalloid ones. Their colour varies, different shades and combinations of green, yellow, red and brown being the most common. The gametophyte is usually about $0.3-0.8 \mathrm{~cm}$ wide by $1-5 \mathrm{~cm}$ long and is generally prostrate and flattened in habit. It usually possesses two rows of large leaves, one on each side of the stem (Fig. 2: 3), and a third row of small leaves (amphigastria) on the undersurface of the stem. Leaf arrangement may be transverse, incubous, or more commonly, succubous. The leaves are unlobed or varously lobed and divided. Sometimes each lateral leaf is tightly foldisd, with one lobe remaining smaller than the other (complicate-bilobed). The margins may be entire, toothed, or fringed with hairs (cilia). The leaves lack a costa and are usually of one layer of cells. Unicellular rhizoids are often present, either scattered on the ventral surface of the stem or restricted to specific parts of the stem or leaves. Yellow, brown, green or red gemmae are frequently present, commonly appearing as granules on leaf margins. The plants are unisexual or bisexual. Antheridia are borne on the sides of the stems surrounded by leaves, while the archegonia are commonly produced at the stem apices or sometimes on short lateral branches (Porella and Chiloscyphus) and are frequently surrounded by a leafy sheath, the perianth. The sporophyte usually has a long colourless seta that elevates the brown to black, spherical or cylindrical capsule above the perianth. The capsule contains spores and elaters, and usually opens by four valves. The sporophyte lasts only a short time and soon dries up after releasing the spores, all of which are shed as soon as the capsule matures.

The mosses have the greatest number of species of all the bryophytes and, as a result, present considerable morphological diversity in both the gametophyte and sporophyte. All mosses (Fig. 2: 4) have a leafy gametophyte, either erect or prostrate, but in some the leaves are scarcely evident. The majority are assorted shades of green but some shades of yellow, red and brown are present in many. Some plants, especially those growing on rock in dry habitats, may even be black. The gametophytes are mostly $1-15 \mathrm{~cm}$ long but they are known to be much shorter ( 1 mm ) and longer ( 60 cm ). The stems are either simple or branched, with the branches sometimes being so numerous that they give the stems a
"feathery" appearance. The leaves are in three to five spiral rows, or rarely in two opposite rows, and usually possess a single or double costa of varying length. They are generally unistratose except in the costa region where many layers of cells occur. Sometimes they are covered with longitudinal flaps or lamellae. The leaf shape varies, with linear, lanceolate and ovate probably being the most common. The leaves of mosses are rarely deeply notched, lobed or dissected like those of the leafy liverworts. However, they can be consistently curved and twisted in various ways and their surfaces may have folds and undulations. The margins can be entire or toothed. The stems of some species, especially those of branched mosses growing prostrate, have numerous, greenish, filamentous structures among the leaves called paraphyllia. Multicellular, reddish brown to whitish rhizoids are nearly always present at the base of the stems, on the surface of the stems growing adjacent to the substratum, or restricted to certain sites on the stems and leaves. Vegetative reproductive bodies, in the form of small, somewhat terete branches or yellowish green gemmae, either in small, leafy cups or on naked stalks, are sometimes evident in a few species treated in this guide. The gametophytes are either unisexual or bisexual. The inflorescences are visible as tiny buds at the apices of stems and short lateral branches or along the sides of stems. The sporophyte is a persistent and long-lived structure, compared to the sporophyte of the liverworts. In most mosses the sporophyte is made up of a slender, elongate seta which terminates in an urn-shaped capsule containing spores. The colour varies, with yellow, brown, orange, red and reddish brown being the most common. Covering the apex of the capsule is a thin, whitish, yellowish or brownish calyptra that is smooth or sometimes hairy. Beneath this is a convex to beaked lid, the operculum, over the mouth of the capsule. A ring of cells beneath the operculum, the annulus, aids in releasing the

FIGURE 2. Structure of bryophytes. 1. Hornwort. 2. Thalloid liverwort. 3. Leafy liverwort. 4. Moss. (AN - annulus; C - costa; CAL - calyptra; CAP - capsule; COL - columella; IN - involucre; LF - leaf; N - neck; NC - Nostoc colony; OP operculum; P - perianth; PER - peristome; R - rhizoids; S - seta; SM - stem; T - thallus; U - urn; V - valve).
operculum from the capsule, but usually it is too small to be seen at low magnification. The mouth of the capsule often is ringed by one or two rows of filamentous to lance-shaped teeth, collectively called the peristome. The peristome teeth are yellow, brown or red and they are always in some multiple of four, from 4-64, with one or two rows of 16 being the most common. Changes in humidity can cause them to twist or bend and thus assist with spore dispersal. Some mosses have no peristome teeth (e.g., Sphagnum) while others have neither a peristome not an operculum, the capsule opening instead by valves (e.g., Andreaea) somewhat like the liverworts. In most mosses the spores are shed over an extended period, and are extracted from the capsule by movement of the peristome teeth.

The mosses may be conveniently divided into two main groups, according to their growth habit and origin of the sporophyte. The acrocarpous mosses generally have erect, simple or sparsely branched gametophytes that grow in tufts and produce sporophytes at the tip of a stem or main branch. The pleurocarpous mosses usually have prostrate, freely branched gametophytes that grow in mats and produce sporophytes laterally from the main stem.

## COLLECTING AND PREPARING A REFERENCE COLLECTION

Bryophytes can be found in a wide variety of moist, shady habitats in eastern Canada. They are water-loving plants because they are so poorly equipped to obtain and retain water and also because they require water for sexual reproduction. For these reasons they commonly grow on forest floors, on boulders in streams and brooks, beside lakes and waterfalls and in dense masses in swamps, fens and bogs. When they do grow in somewhat arid regions they always occur in a microhabitat where they can obtain the maximum amount of moisture. They avoid salt water except for a few species that always occur in the spray zone beside the ocean (e.g., Schistidium maritimum). Most species grow on soil, rock, trees, rotting wood and humus, though occasionally some species grow on such bizarre substrata as animal remains.

A $10-20 x$ hand-lens is essential for field work in order to see the minute detail of the bryophytes. Several plants of each species should be removed from the substratum with the fingers or a knife. Plants containing an excessive amount of water should be squeezed out. Mosses in dense tufts should be divided into small groups so that they will dry faster. Plants bearing mature sporophytes should be collected whenever possible. Both male and female plants should be collected when unisexual species are encountered. Each bryophyte collection is put into a prefolded newspaper packet made from one-half of a page (Fig. 3) and the substratum recorded on the outside of the packet with a felt tip marking pen or some other permanent type of marker that will not smear when wet. The locality is also recorded on each packet, usually with a code number. The locality information, including the province, county or district, distance to nearest town, longitude and latitude, the date and any ecological information, such as exposure, moisture, surrounding vegetation (e.g., beech-maple woods), should be recorded in a field book. All collections from one locality are kept together in a collecting bag (cloth or plastic). Small paper sacks (2 1b.) may be used instead of newspaper packets but the plants often clump-up inside and take longer to dry. Upon returning home or to a field camp the bryophytes should be prepared for rapid drying to prevent the growth of mold and to preserve the colour. The newspaper absorbs much of the moisture from the plants. Any packets that are thoroughly wet or torn should be replaced. Approximately 30-50 packets are then placed in a fish-net bag (cotton decorative netting is the best and least expensive) and hung up to dry. The packets should be tumbled in the bag every few hours to facilitate drying. If a dry indoor room is available, the packets can simply be unfolded and spread out on the floor instead of using the bag method.

After the specimens are dry they are put into permanent packets for a reference collection. Packets are folded from sheets of white paper ( $21.5 \times 28 \mathrm{~cm}$ ) of good quality (50-100\% rag content with $20-24 \mathrm{lb}$. weight) resulting in a standard size of about $10 \times 14.5$ cm (Fig. 4). The bryophytes should be further cleaned and trimmed of excess substratum so they will fit into the packet. A smaller packet may be folded for small plants or loose parts and placed inside the standard packet. Each collection is given a separate number. The name of the bryophyte and the collecting data are put on the packet's flap or a separate label slightly smaller than the flap onto which it is to be pasted (Fig. 5). The label should bear the following information: name(s) of bryophyte(s) with author(s), country

(optional), province, county or district, locality (including kilometers to nearest town, longitude and latitude), habitat (including substratum), date collected, collector, collection number, person who identified specimen if different from collector, and year identified. The specimens may then be conveniently stored in shoe boxes for future reference.

IDENTIFICATION AND METHODS OF STUDY

To identify a bryophyte, a dried plant is removed from its packet and revived to its original appearance by soaking it in a small dish of water for a minute or so. A $10-20 \%$ solution of household liquid detergent may be used to speed up the wetting process. The
plant may then be examined by placing it on microscope slide or on a thin piece of clean glass about 8 cm square. A dissecting microscope with magnification up to 25 or 50 x and with a transmitted light base is ideal for studying the superficial features of bryophytes. However, if a microscope is not available, a $10-20 x$ hand-lens may be substituted with a certain degree of success. The only other equipment required is two dissecting needles, tweezers and a metric ruler.

Hornworts and liverworts are best observed without being dissected, but mosses often need to have some leaves removed from the stem in order to look for a costa, teeth on the margins, alar cells or other important features. Only leaves from about the middle third of the stem should be removed since they are the most mature and fully developed. Leaves of large mosses may be removed with tweezers by pulling downward and away from the stem apex in order to get the entire leaf with the alar cells intact. The leaves of small mosses are easier to remove by using two dissecting needles. One needle is used to hold the plant down while the other is used to scrape off the leaves, always scraping from the stem apex toward the base.

When it is necessary to remove the operculum of a moss capsule to look at the peristome teeth, a small hole should be made in the capsule wall before soaking the capsule so the water can enter faster. A firmly attached operculum may eventually have to be forced off with dissecting needles and in this case the teeth may remain inside the operculum.

Thalloid liverworts are most easily studied from freshly collected material. Observations of the nature of the scales, air chambers and colour should be noted for each collection so that this information is available when the specimen is to be determined.

The techniques used to study the leafy liverworts are generally the same as for the mosses. Observations should be made on the most typical leaves of the plant which are near the middle third of the stem. The three types of leaf insertion (the line at which the leaf joins the stem), transverse, succubous and incubous, are important features used to distinguish the genera. When determining the type of leaf insertion it is important to observe the plant from above (i.e., looking down on the dorsal surface) with the stem spex pointing away from the observer. The presence of underleaves and rhizoids will aid in distinguishing the ventral surface.

Listed below are a few illustrated books that the beginner may find useful when
identifying bryophytes of eastern Canada.

Conard, H.S. 1979. How to Know the Mosses and Liverworts. Second edition. Revised by P.L. Redfearn, Jr. 302 pp. Includes hornworts, liverworts and mosses. Available from W.C. Brown Company Publishers, 135 South Locust, Dubuque, Iowa 52001.

Crum, H.A. 1983. Mosses of the Great Lakes Forest. Third edition. 417 pp . Intended for identification of mosses of northern Michigan but it works well in our region. Available from University of Michigan, Ann Arbor, Michigan 48109.

Ireland, R.R. Moss Flora of the Maritime Provinces. 738 pp.
Covers the mosses of New Brunswick, Nova Scotia and Prince Edward Island but it can be used to a great extent for the other eastern provinces. Available from McClelland and Stewart Limited, 25 Hollinger Road, Toronto, Ontario M4B 3G2.

Schuster, R.M. 1977. Boreal Hepaticae, a Manual of the Liverworts of Minnesota and Adjacent Regions. Bryophytorum Bibliotheca 11. 606 pp. (Reprint of the American Midland Naturalist 49(2): 257-684. 1953). Intended for the identification of hornworts and liverworts of eastern United States but it is also good for our region, although some of the names are outdated. Available from J. Cramer, FL-9490 Vaduz, Germany.

The advanced student will find the following books useful:

Crum, H.A. and L.E. Anderson. 1981. Mosses of Eastern North America. 2 Vols., 1328 pp. Available from Columbia University Press, 136 South Broadway, Irvington-on Hudson, New York 10533.

Schuster, R.M. 1966-79. The Hepaticae and Anthocerotae of North America East of the Hundredth Meridian. 4 Vols. (More to be published). Also available from Columbia University Press.

The keys that follow may be used to determine the name of an unknown bryophyte. In each key there are always two identically numbered or lettered statements. The user should read both statements and select the one that more accurately fits the plant being identified. The leaders to the right of each statement indicate either a name, which is that of the bryophyte or group of bryophytes in the General Key, or another number or letter. If it is a number or letter, proceed to that number or letter and again make a choice, always selecting the statement that better describes the plant being identified. When a name is reached, indicating the identity of the bryophyte, the illustrations should be checked carefully to make certain they match the plant. Immediately following the scientific binomial is the name of the person(s), usually abbreviated, responsible for it. The distribution of each bryophyte is given first for eastern Canada, followed by its occurrence throughout North America. A two-letter abbreviation is used for the geographic localities which are listed near the end of the guide.

One word of caution is necessary. Since many of the 235 bryophytes contained in this guide resemble others from the region that are not included (ca. 520 additional species), it is possible to key out an excluded species to one that is contained in this treatment. Therefore, the identified specimen should be verified by a bryologist whenever possible. Robert R. Ireland is willing to verify specimens as long as he is contacted in advance and as long as large numbers of specimens are not sent.

5. Thalli small, usually less than 1 cm wide, marginsusually purplish or reddish; diamond-shaped markingsnot visible with naked eye; gemmae cups lacking4
6. Thalli large, of ten more than 1 cm wide, margins notpurplish or reddish; diamond-shaped markings oftenvisible with naked eye; gemmae cups sometimes presenton dorsal surface of thallus.................................................................................... 5
7. Thalli with diamond-shaped markings clearly visible with lens; cells around the pores raised; margins plane............................................
Preissia quadrata (Scop.) Nees Fig. 8 On soil over moist, calcareous shale and sandstone, sometimes in marly.ditches. NF to ON--GR, throughout Canada and the northern U.S.
8. Thalli with diamond-shaped markings lacking or indistinct with lens; cells around the pores not noticeably raised; margins ascending or
inrolled Reboulia hemisphaerica
Reboulia hemisphaerica (L.) Raddi Fig. 9 (Purple-Margined Liverwort) On dry rock or on soil over rock. NB to MB--NB to BC and throughout U.S.
9. Thalli with gemmae-cups on dorsal surface; nonaromatic even when crushed; male and female receptacles often present, stalked................................
Marchantia polymorpha L. Fig. 10
(Common Liverwort)
On moist soil (nonorganic) in burned-over areas, sometimes in marly bogs. NF to MB--GR, throughout Canada and U.S.
10. Thalli lacking gemmae-cups; plants strongly aromatic, especially when crushed; male and female receptacles rarely present, the male sessile
Conocephalum conicum (L.) Lindb. Fig. 11
(Great Scented Liverwort)
On damp soil, rock, or rotten logs, primarily along streams.
NF to MB--throughout most of Canada and U.S.
11. Thalli with costa and sometimes with small, dark
spots (Nostoc colonies within the thallus) .....  7
12. Thalli lacking costa or costa indistinct, without small, dark spots. ..... 10
13. Thalli margins lobed ..... 8
14. Thalli margins not lobed (sometimes gemmae on margins of Metzgeria looking like small lobes) .....  9
15. Thalli with small, dark spots (Nostoc colonies within the thallus) scattered along margin; flask-shaped gemmae receptacles often present near thalli apices................. 12
Blasia pusilla L . Fig. 12
On moist, denuded, loamy or clayey banks, ditches or paths. NF to MB--GR to MB, south to NC, MI and IA; in the West from AK to CA; also in NM.
16. Thalli lacking dark spots and gemmae receptacles. Pellia epiphy11a Pellia epiphylla (L.) Corda Fig. 13

(Wide-Nerved Liverwort)

         On shaded moist soil or rocks. \(N F\) to \(M B--L B\) to \(A K\),
    
         south to GA, AL, TN, WI, MT, WY and WA.
    17. Thalli large, 2 mm wide or more, lacking hairs onOn decaying wood, rocks and soil in bogs and swampy places.$N F, N B, N S, Q U, O N--N F$ to $O N$, south to $F L, A L$ and TX.
18. Thalli small, usually less than 2 mm wide, hairs on margin. ..... Metzgeria

## METZGERIA

A. Thalli with some marginal hairs in groups of two, ventral surface with hairs only on costa;

Metzgeria conjugata Lindb. Fig. 15: 1-3
On moist shaded rocks, sometimes on trunks of trees. NS, QU, ON--NS to ON, south to FL, TN, MI and WI; in the West from $A K$ to CA; also in NM.
A. Thalli always with marginal hairs single, ventral surface with hairs scattered throughout; multicellular gemmae common

Metzgeria furcata (L.) Dum. Fig. 15: 4-6
On shaded cliff faces and ledges, occasionally on bases of trees. NF, NB, NS, QU--NF to MI, south to GA and TN.
10. Thalli thin and translucent, individual cells often evident, dichotomously branched.11
10. Thalli thick and individual cells not evident, irregularly branched ..... 12
11. Thalli narrow, $1-2 \mathrm{~mm}$ wide; plants usually aquatic,submerged.Riccia fluitans
Riccia fluitans L. ..... Fig. 7: 1-2
(Floating Crystalwort)
Floating just beneath the surface in water of quiet streamsor ponds, sometimes stranded on mud when water recedes.QU, $O N, M B-Q U$ to $B C$, south throughout most of $U$.S.
11. Thalli broad, 3 mm or more in width; plants terrestrial ..... Pellia epiphylla (See p. 24)
12. Thalli sparingly branched, broad, 3 mm or more
in width................................................................................. Aneura pinguis
Aneura pinguis (L.) Dum. Fig. 16: 1
Predominantly a calciphile occurring in swamps,ditches and on thin soil over limestone or basaltbut sometimes on rotten logs and stumps. NF, NS,QU, $O N, M B--G R$ to $A K$, south throughout U.S.12. Thalli much branched, narrow, less than 3 mm wide.-Riccardia

## RICCARDIA

    15. Underleaves entire, lanceolate............................................................................... anomala Mylia anomala (Hook.) S. Gray Fig. 32: 1-4 Over Sphagnum in peat bogs and on moist ledges. NF to MB-GR to AK, south to NJ, WV, MI, WI, MN, MB, SA, AT and WA.
16. Leaves 3-4 lobed ..... 17
17. Leaves 2, rarely 3, lobed ..... 18
18. Leaves with deeply channelled lobes, the margins
Tetralophozia setiforais (Ehrh.) Schljak. Fig. 32: 5-7On dry, granitic rock or on ground between boulders.$\mathrm{NF}, \mathrm{QU}, \mathrm{ON}-\mathrm{GR}$ to ON , south to $\mathrm{ME}, \mathrm{NH}, \mathrm{VT}$ and NY ; inthe West from AK to YT, south to BC and AT.
19. Leaves without channelled lobes and reflexed margins. ..... Barbilophozia

## BARBILOPHOZIA

A. Leaves mostly 3-lobed, rarely 4-1obed; numerous, erect flagellae arising from stem apices. - B. attenuata

```
            Barbilophozia attenuata (Mart.) Loeske Fig. 33: 1-4
                        On boulders, cliff faces and ledges and decaying logs
                        and stumps. NF, NB, NS, QU, ON--GR to ON, south in
                        the mountains and northern states to NC, TN, MI, WI
                        and MN; in the West from AK to BC, south to WA, MT and CO.
A. Leaves mostly 4-lobed, rarely 3-1obed;
    flagellae lacking B
B. Leaves acute to obtuse, never mucronate tipped, lacking cilia; underleaves small and indistinct...................................................................... barbata Barbilophozia barbata (Schmid. ex Schreb.) Loeske Fig. 33: 5-7 Usually on acidic cliff faces and ledges, sometimes on boulders, rarely on rotting logs, mainly in coniferous forests. NF to MB--GR to AK, south to NC, TN, MI, WI, MN, MB, SA, NM, MT, ID and WA.
B. Leaves usually mucronate tipped, the postical leaf base with cilia; underleaves large and distinct........................................................... \(C\)
C. Plants green or brownish, leaves flat or weakly crisped, middle leaf lobe about as broad as long; reddish brown gemmae often
```

```
Barbilophozia hatcheri (Evans) Loeske Fig. 34: 1-4 Predominantly on acidic cliff faces and ledges, sometimes on boulders, in spruce-fir woods. NF, NB, NS, QU, ON, MB--GR to MB, south to NH, VT, NY, MI and MN; also in NC; in the West from \(A K\) to YT, south to CA, MT and CO.
C. Plants whitish or yellowish green, leaves strongly undulate-crispate, middle leaf lobe about twice as broad as long; gemmae lacking......................B. lycopodioides
Barbilophozia lycopodioides (Wallr.) Loeske Fig. 34: 5-7
On acidic cliff faces and ledges, boulders, sometimes on humus over calcareous rock in spruce-fir woods. NF, NB, NS, QU, ON, MB--GR to \(M B\), south to \(M E\), \(N H\) and \(M I\); in the West from AK to YT, south to WA, UT and NM.
```

19. Underleaves entire, attached on one side of base of lateral leaves........................................................................ Harpanthus scutatus
Harpanthus scutatus (Web. \& Mohr) Spruce Fig. 35: 4-6Often on siliceous rocks, more rarely on moist decayedlogs, humus and peaty soil in damp, shaded sites. NFto $O N--L B$ to $O N$, south to $N C, T N, M I, I A$ and $M N$; in theWest from BC and AT.
19. Underleaves bilobed or ciliate, rarely entire, not attached to lateral leaves ..... 20
20. Underleaves bifid nearly to base, the margins
without cilia Geocalyx graveolens
Geocalyx graveolens (Schrad.) Nees Fig. 35: 7-9
On humus or peaty soil, moist, decaying wood, onmineral soil, or on thin soil over rocks. NF toON--NF to ON, south to NC, TN, IL, MN and KS; inthe West from AK to YT , south to CA and ID.
20. Underleaves bifid, divided $1 / 2-2 / 3$ their length,usually ciliate, or underleaves entire............................................................ 21
21. Rhizoids confined to bases of underleaves;
underleaves ciliate. ..... Lophocolea

## LOPHOCOLEA

Note - The genus Chiloscyphus has recently been redefined to include Lophocolea. The new names for the two species listed below are Chiloscyphus minor (Nees) Engel \& Schust. (for L. minor) and C. profundens (Nees) Engel \& Schust. (for $\overline{\mathrm{L}}$. heterophylla).
A. Plants small, $0.5-1.0 \mathrm{~mm}$ wide, usually sterile, clusters of yellowish green gemmae on margins of leaves....................................................................
Lophocolea minor Nees Fig. 36: 1-3
Common on loamy soil banks, in crevices of calcareous shales and sandstones, and on moist rotten logs. NF, NB, NS, QU, ON, MB--NF to MB, south to VA, TN, IL, IA and KS; in the West from AK to YT, south to BC, ID, UT and MT.
A. Plants large, 1-2 mm wide, usually fertile and perianths present, gemmae lacking.......................................
Lophocolea heterophylla (Schrad.) Dum. Fig. 36: 4-6 Commonly on decaying wood but also on organic substrata, such as tree bases and peat in old dried-out bogs; sometimes on moist soil along streams, and on damp rocks. NF to $\mathrm{ON}--\mathrm{NF}$ to ON , south to $\mathrm{FL}, \mathrm{AL}, \mathrm{MS}, \mathrm{LA}$ and TX ; in the West from BC to SA, south to CA, ID and WY.
21. Rhizoids scattered throughout ventral surface of stems; underleaves sometimes entire.............................................................. Lophozia
A. Plants with underleaves .....  B
A. Plants lacking underleaves. ..... C
B. Underleaves ciliate; gemmae lacking ..... rutheana
Lophozia rutheana (Limpr.) M.A. Howe Fig. 37: 1-3 A calciphile occurring on wet ground in cedar swamps and rich fens. $N F, Q U, O N, M B--G R$ to $M B$, south to $N Y, M I$ and $M N$; in the West from $\mathrm{AK}, \mathrm{BC}, \mathrm{YT}$ and SA.
B. Underleaves entire; gemmae usually present, brownish, on leaf margins at tips of 
Lophozia heterocolpos (Thed.) M.A. Howe Fig. 37: 4- $\overline{7}$
On calcareous rocks or rarely on decaying logs. NF, QU, ON--GR to ON, south to ME, NH, VT, MI, WI and MN; in the West from AK to YT, south to CA, ID and MT.
C. Leaf lobes toothed. L. incisa
Lophozia incisa (Schrad.) Dum. Fig. 38: 1-4
An acidophile, on moist, decaying logs, peaty banks, humus-covered rocks, or sometimes on bare, moist rocks. $N F$ to $M B-G R$ to $M B$, south in the mountains and northern states to NC , TN, MI, WI and MN; in the West from AK to YT, south to CA, NV and NM.
C. Leaf lobes entire ..... D
D. Leaves about as wide long, the sinus broadand shallow; gemmae greenish or yellowish green.................
Lophozia ventricosa (Dicks.) Dum. Fig. 38: 5-8
On moist, shaded rocks, decaying logs and
peaty soil. NF to $M B--G R$ to $A K$, south to
$\mathrm{NC}, \mathrm{TN}, \mathrm{MI}, \mathrm{WI}, \mathrm{MN}, \mathrm{MB}, \mathrm{CO}, \mathrm{MT}, \mathrm{ID}$ and CA.
D. Leaves much longer than wide, the sinus narrow and deep; gemmae orange or reddish brown..................................................................... longidens
Lophozia longidens (Lindb.) Mac. Fig. 38: 9-12 On acidic rocks, decaying wood and bases of trees. NF, NS, QU, ON--GR to ON, south to CT, NY, MI, WI and MN; in the West from BC to AT, south to OR, ID, MT and CO.
22. Leaves undivided or nearly so. ..... 23
22. Leaves 2-4 lobed ..... 26
23. Rhizoids purple or violet; leaves wavy or ruffledwhen dry
Fossombronia foveolata Lindb. Fig. 39: 1-4On damp, sandy soil at lake margins and beside streams.NS, QU, ON--NS to ON, south to NC, TN, MI and WI; in theWest from BC to OR.
23. Rhizoids not purple or violet, usually hyaline or brownish; leaves not wavy or ruffled when dry. ..... 24
24. Leaves usually with serrated margins. ..... Plagiochila porelloides
Plagiochila porelloides (Torrey ex Nees) Lindenb. Fig. 39: 5-6
(Spleenwort Hepatic)
On moist rocks and shaded, soil-covered banks, rarely
on rotten logs, stumps and bases of trees. NF to
MB--GR to MB, south to GA, KY and AR; in the West
from $A K$ to $S A$, south to $C A, I D, M T$ and NM.
24. Leaves with entire margins (female bracts sometimes cillate). ..... 25
25. Plants green to reddish brown; female bracts ciliate at base; perianth tapered to a ciliate mouth; common,

    on rotten wood, soil or rocks, never in streams.........................Jamesoniella autumnalis
    
        Jamesoniella autumalis (DC.) Steph. Fig. 40: 1-3
    
            Usually on decaying logs or acidic rocks, sometimes on
    
            shaded banks and occasionally on bases of trees. NF to
    
            MB--NF to AK, south to FL, TN, MS, MO, KS, WY, MT, ID and OR.
    25. Plants green or some plants reddish with a border of

enlarged cells; female bracts entire; perianths truncate

or tapered, the mouth entire; infrequent, on rotten wood,

## JUNGERMANNIA

A. Leaves with a distinct border of large,
swollen cells........................................................................ gracilima
Jungermannia gracillima Sm. Fig. 40: 9-10 On sandy, loamy or clayey banks. NF to ON-GR to ON, south to FL, AL, MS, WI and IA.
A. Leaves lacking border of enlarged cells. B

B. Leaves oblong-oval, often slightly
retuse at apex; perianth truncate at

    apex; plants mostly in mesic habitats........................................ leiantha
    
            Jungermannia leiantha Grolle Fig. 40: 4-6
    
            On moist rock, on soil over rock, on decaying
    
            logs and on peaty ground in boggy areas. NF,
    
            NS, PE, QU, ON--LB to ON, south to GA, AL, MI,
    
            \(W I, M N\) and \(K S\); in the West from \(A K\) and \(B C\),
    
                    south to CA, ID, MT and UT.
    B. Leaves cordate to nearly rounded, not retuse
at apex; perianth tapered at apex; plants in
aquatic habitats........................................exsertifolia ssp. cordifolia

Jungermannia exsertifolia ssp. cordifolia (Dum.) Vana
Fig. 40: 7-8

On rocks in or beside silt-free streams. NF, NS,
QU, ON-NF to ON, south to CT, NY, MI and WI; in
the West from AK to AT, south to CA, ID and CO.

[^0]27. Leaf lobes all about the same size ..... Barbilophozia (See p. 43)
27. Leaf lobes unequal in size, the dorsal lobe much shorter than the ventral lobe ..... 28
28. Leaf lobes entire; gemmae reddish brown, sometimes lacking ..... Tritomaria

## TRITOMARIA

A. Leaves as wide or wider than long; gemmae

Tritomaria quinquedentata (Hedw.) Buch Fig. 41: 1-3 On basic rock outcrops and around rock pools. NF, NB, NS, QU, ON, MB--GR to MB, south to CT, NY, MI, WI and MN; in the West from AK to YT, south to BC and AT.
A. Leaves longer than wide; gemmae usually
present, reddish brown.......................................................... Tritomaria exsectifornis (Breidl.) Loeske Fig. 41: 4- $\overline{6}$ On decaying logs and peaty soil over acidic cliffs. NF, NB, NS, QU, ON--NF to ON, south to MA, NY, MI, WI and IA; also in NC; in the West from AK to YT, south to BC, AT, ID, MT and CO.
28. Leaf lobes toothed; gemmae green or yellowish green, usually present ..... Lophozia (See p. 46)
29. Leaves strongly concave and sac-like, each lobe ending in a long, slender cilium; occurring only 
Nowellia curvifolia (Dicks.) Mitt. Fig. 42: 1-3On moist decaying logs. NF to ON--NF to ON ,south to GA, TN and AR.
29. Leaves neither sac-like nor ending in long cilia; on wood and other substrates ..... 30
30. Leaves transverse ..... 31
30. Leaves succubous. ..... 32
31. Leaves deeply divided, $1 / 3-1 / 2$ their length; gemmae usually present, reddish or purplish brown. Anastrophyllum

## ANASTROPHYLLUM

A. Plants small, gemmiferous shoots filiform,
0.5-1.5 mm wide.................................................................. A. minutum
Anastrophyllum minutum (Schreb.) Schust. Fig. 42: 4-6
On peaty soil, often among mosses and on damp, shaded
rocks. NF, NB, NS, QU, ON--GR to ON, south in the
mountains and northern states to NC, TN, MI and MN;
in the West from AK to YT, south to WA and ID.
A. Plants larger, gemmiferous shoots not
filiform, $1.0-2.5 \mathrm{~mm}$ wide....................................................... ${ }^{\text {. }}$.
31. Leaves shallowly divided, $1 / 8-1 / 3$ their length;

## MARSUPELLA

32. Leaf lobes obtuse to broadly rounded. ..... 33
32. Leaf lobes acute to acuminate. ..... 34
33. Leaves somewhat concave, about as broad as long, 
Gymocolea inflata (Huds.) Buch Fig. 44: 1-3 On humus over wet to moist, acidic rocks and rock outcrops, or sometimes in depressions in bogs. $N F$ to $M B--G R$ to $A K$, south to $N J, P A, M I, M N, S D, W Y, A T$ and $C A ;$ also in NC, TN and AR.
33. Leaves flat, much longer than broad, the ventral lobe larger than the dorsal lobe. ..... Cladopodiella fluitans (See p. 44)
34. Plants small, usually $0.5-1.0 \mathrm{~mm}$ wide, stems transparent; leaves deeply cleft, the lobes often connivent Cephalozia

## CEPHALOZIA

A. Leaves deeply divided, the sinus extending $1 / 2$ or more the leaf length, the lobes nonconnivent. bicuspidata

Cephalozia bicuspidata (L.) Dum. Fig. 44: 4-5
On moist, acid rocks, mineral soil and peaty or sandy banks beside streams, sometimes on decaying logs. NF to ON--GR to AK, south to GA, TN, IL, IA, KS, CO, UT, ID and CA.
A. Leaves more shallowly divided, the sinus extending less than $1 / 2$ the leaf length, the lobes usually connivent................................................... . lunulifolia

Cephalozia lunulifolia (Dum.) Dum. Fig. 44. 6-7
Most often on decaying wood and in peat bogs, but also on moist rock, in soil-filled rock crevices and on soil banks. NF to MB--GR to AK, south to $\mathrm{FL}, \mathrm{TN}, \mathrm{LA}, \mathrm{KS}, \mathrm{WY}, \mathrm{ID}, \mathrm{NV}$ and CA.

```
34. Plants large, mostly over l mm wide, stems
    opaque; leaves shallowly cleft, without

In hummocks in open areas of bogs, sometimes in fens. NF to MB--GR to AK, south to FL, KY, IA, TX, ID and CA.
C. Branch leaves not cucullate, longer than broad.................... S. capillifolium Sphagnum capillifolium (Ehrh.) Hedw. Fig. 46: 5-8
In hummocks in bogs and fens and in wet depressions, on humus and wet rocks in woods. NF to MB--GR to $A K$, south to NC, MI, IN, WI, MN, AR, KS, CO, MT and WA.
2. Plants without branches in fascicles; often in dry habitats..................................... 2
3. Plants erect, small, stems less than 2 cm high, brown to reddish brown or black, leaves often without a costa; capsules eperistomate, opening most of their length by
4 longitudinal slits when dry; on noncalcareous rock....................................Andreaea

ANDREAEA
A. Leaves ovate to ovate-lanceolate, ecostate;
common. ............................................................................... . rupestris
Andreaea rupestris Hedw. Fig. 47: 1-5
On exposed, acidic boulders and cliffs. $N F$ to MB--
GR to AK, south to GA, MI, MN, CO and northern CA.
A. Leaves narrowly lanceolate, costate; rare. ..... A. rothii
Andreaea rothii Web. \& Mohr Fig. 47: 6-9

            On shaded, acidic boulders and cliffs. NF, NB,
    
            NS, ON--GR to ON and MI, south in the mountains
    
            to GA and TN; in the West from AK to northern CA.
    2. Plants otherwise; capsules peristomate or eperistomate, opening by an operculum .....  3
3. Plants apparently lacking leaves; capsules large and prominent with a somewhat flattened upper surface, 5-7 mm long, on long, warty setae.....................................................Buxbaumia aphy11a Buxbaumia aphylla Hedw. Fig. 48: 1-4 (Bug-on-a-Stick Moss)
A rare and unusual moss on humus in woods, soil under shrubs and on stumps and logs. NF to $\mathrm{ON}--\mathrm{NF}$ to AK , south to NC, MI, IL, IA, CO, MT and WA.
4. Plants with conspicuous leaves; capsules usually smaller ..... 4
5. Leaves in two distinct rows. ..... 5
6. Leaves in more than two rows .....  6
7. Leaves broad, often over 1 mm wide, with a flap fusedonto the upper surface to form a large sheath................................isissidens adiantoides
Fissidens adiantoides Hedw. Fig. 49: 1-3In woods on moist soil banks, rotten logs, humus, woodydebris, or often on calcareous rocks and cliffs besidestreams, sometimes in the spray of waterfalls. NF to
ON--GR to ON and $\mathbb{M N}$, south to FL, LA and AR; in the West
from AK to CA; also in WY.
8. Leaves narrow, less than 1 mm wide, lacking flap...................... Distichium capillaceum

         Distichium capillaceum (Hedw.) B.S.G. Fig. 49: 4-6
    
         On calcareous rock, primarily in cliff crevices,
    
         sometimes on soil or humus over rock. \(N F\) to MB--GR
    
         to \(A K\), south to \(N Y, M I, I A, S D, N M, A Z\) and \(C A\).
    

7. Plants greenish white, usually $3-6 \mathrm{~cm}$ high, in large, rounded, dense cushions on the ground; leaves close, tubulose......................... Leucobryum glaucum
Leucobryum glaucum (Hedw.) Ångstr. ex Fries Fig. 50: 1-4(Pin Cushion Moss)
On moist soil or humus, frequently on slopes in woods,
occasionally in swampy woods or woods beside lakes. NF
to MB--NF to MB, south to FL, MS, LA and OK.
7. Plants not greenish white or if so, not in dense cushions and without tubulose leaves. ..... 8
8. Plants in tufts and cushions, main stems erect, or nearly so, simple or with only a few branches, the branches sometimes short and tuft-like; costae usually prominent, single; sporophytes arising from stem apices or the apices of branches below (acrocarpous mosses). .....  9
8. Plants in mats, main stems prostrate or nearly so, sometimes with erect tips, usually much branched, often pinnate or rarely simple and if so, the stems long and intertwined; costae often indistinct, single, double or frequently lacking; sporophytes arising from main stem somewhere below apex (pleurocarpous mosses) ..... 58
9. Gemmae cups (formed by apical leaves) present at the tips of gemmiferous shoots; capsules cylindric with 4 large peristome teeth; common, usually on rotten wood.................Tetraphis pellucida Tetraphis pellucida Hedw. Fig. 50: 5-10
Usually on coniferous rotten wood, such as logs, tree trunks, stumps, sometimes on woody humus, rarely on moist sandstone. NF to $M B-L B$ to $A K$, south to $S C, A L, A R, S D$, $\mathrm{CO}, \mathrm{AZ}$ and CA.
9. Gemmae cups lacking; peristome teeth 16 or more; on various substrata ..... 10
10. Leaves with lamellae on upper surface; peristome teeth attached by their tips to a membrane covering the mouth of the capsule. ..... 11
10. Leaves lacking lamellae; peristome teeth, if present, not attached to a membrane ..... 13
11. Lamellae few, less than 10 ; leaves undulate, crisped or contorted when dry, costae narrow; calyptrae 

## ATRICHUM

A. Leaves broad, usually less than 4 times as
long as wide, without teeth on back of lamina (sometimes a few teeth on back of costa)............................................ crispum

            Atrichum crispum (James) Sull. Fig. 51: 1-3
    
                    Usually on sandy soil along streams, in
    
                    disturbed fields and roadside ditches,
    
                    sometimes at margins of swamps. NB, NS,
    
                    PE, QU, ON--NS to ON, south to FL, TN and IA.
    
            A. Leaves narrow, usually more than 5 times as
    
        long as wide, with rows of teeth on back of lamina. ..... B
    B. Plants small, stems up to 3 cm high,
sparsely leaved, of ten producing
sporophytes; usually in dry habitats
in woodlands and along roads................................................. altecristatum
Atrichum altecristatum (Ren. \& Card.) Smyth \& Smyth Fig. 51: 4-8
On soil banks or hummocks, often in clearings
in woodlands, frequently along roads or trails.
NF to MB--NF to MB, south to NC, TN, AR and KS.
B. Plants large, stems up to 6 cm high,
densely leaved, rarely producing
sporophytes; mainly in wet habitats,
along streams and at margins of swamps................................ oerstedianum
Atrichum oerstedianum (C. Mü11.) Mitt. Fig. 52: 1-3
On soil in moist, shaded habitats or in
extremely wet habitats along streams, beside
falls and at margins of swamps. NF to ON--
LB to ON, south to NC, TN, MS and LA.
11. Lamellae numerous, more than 10; leaves rigid, not
undulate, scarcely contorted when dry, costae broad;
calyptrae hairy.12
12. Stems simple; leaves sometimes with a reddish or whitish awn; capsules 4-angled. ..... Polytrichum
POLYTRICHUM(Hair-Cap Moss)
A. Leaf lamina with entire and infolded margins that cover lamellae ..... B
A. Leaf lamina with margins serrate to middle and not folded. ..... D
B. Leaves ending in a whitish hair point. Polytrichum piliferum Hedw. Fig. 52: 4-8
On sandy or gravelly soil in open, often disturbed sites, especially fields, roadbanks, and borrow pits. $N F$ to $M B--G R$ to $A K$, south to $N C$, $T N, L A, C O$, UT and CA.
B. Leaves ending in a reddish hair point (sometimes whitish at base) ..... C
C. Stems long, often over 5 cm high, commonlymatted with whitish rhizoids; leaveserect-imbricate when dry; plants of bogs........................................ strictum
Polytrichum strictum Brid. Fig. 53: 1-5In bogs or at margins of bogs in hummocks,often among Sphagnum. NF to MB--GR to AK,south to GA, OH, MI, IL, MN, CO, MT and WA.
C. Stems short, seldom up to 5 cm , rhizoidsscarcely noticeable; leaves spreading;
Polytrichum juniperinum Hedw. Fig. 53: 6-9
Usually on soil or soil over rock in dry, open,
mainly disturbed habitats, such as roadbanks,
logged woodlands, pastures, etc. NF to MB--GR
to $A K$, south to $G A, A L, A R, K S, C O, A Z$ and $C A$.
D. Capsules short, about as long as wide ..... P. commune
Polytrichum comme Hedw. Fig. 54: 1-5On soil or humus in bogs, wet woods, swamps,or sometimes drier habitats, such as trailsand roadside banks. NF to $M B--G R$ to $A K$,south to FL, MS, LA, TX, CO, AZ and CA.
D. Capsules elongate, definitely longer than wide

            Polytrichum ohioense Ren. \& Card. Fig. 54: 6-9
    
                On soil or humus over boulders, stumps and
    
                overturned tree roots in woodlands. \(N F\) to
    
                ON-NF to ON, south to GA, AL, MS, AR and
    
                OK; also in NM.
    12. Stems simple or sometimes branched; leaves without awn; capsules terete

Pogonatum

## POGONATUM

```
A. Plants large, stems 2-9 cm high, branched;
    on soil over boulders, cliff shelves and
```

```
        Pogonatum alpinum (Hedw.) Röh1. Fig. 55: 1-4
            On soil over boulders, cliff shelves and in
            cliff crevices, predominantly near streams
            in coniferous woods. NF to ON--GR to AK,
            south in the mountains and northern states
            to NC, WV, MI, MN, CO, UT, ID and CA.
A. Plants small, stems 0.1-0.6 cm high, simple;
        the persistent protonema forming a greenish
        coating on soil; on bare clay banks along
```

```
            Pogonatum pensilvanicum (Hedw.) P. Beauv. Fig. 55: 5-\overline{9}
            On bare clay banks in open habitats, such as
            roadsides, streams and woodland clearings. NF
            to ON--NF to ON, south to FL, MS, LA and KS.
```

13. Leaves narrow, of ten subulate, $10-20$ or more times as long as leaf width near middle; costae usually covering most of leaf near middle............................................................................ 14
14. Leaves broad, lanceolate, ovate, obovate or oblong, mostly less than 10 times as long as broad; costae often covering only a small portion of leaf near middle......................................... 24
```
14. Leaves squarrose, with an enlarged base clasping
    the stem; capsules horizontal, strumose; usually
    on wood.........................................................
        Oncophorus wahlenbergii Brid. Fig. 56: 1-4
            On rotten logs, stumps and tree bases, or sometimes on
        soil or humus over rock, in coniferous woods. NF to
        MB--GR to AK, south to WV, MI, MN, SD, CO, MT and BC.
    14. Leaves not squarrose or if squarrose, without
    enlarged clasping base; capsules erect to
    horizontal, struma lacking or indistinct; on
    a variety of substrata15
```

15. Alar cells noticeably differentiated, often inflated and red or orange. ..... 16
16. Alar cells not noticeably differentiated ..... 18
17. Leaves short, about 3 mm long, entire; stemsshort, about 2 cm high, red; capsules rare,short, pyriform; on rock along streams andnear waterfalls..........................................................................Blindia acuta
Blindia acuta (Hedw.) B.S.G. Fig. 56: 5-7
On wet boulders, cliff faces and ledges, frequently
near waterfalls. $N F$ to $O N--G R$ to $A K$, south in the
mountains and northern states to $\mathrm{SC}, \mathrm{TN}, \mathrm{MI}, \mathrm{WI}, \mathrm{MN}$,
CO, MT, ID and CA.
18. Leaves long, mostly more than 3 mm , serrate on
margins and back of costa; stems long, nearly
always more than 2 cm high, usually green or
brown; capsules common, long, cylindric; on rock
or various substrata.................................................................................... 17
19. Costae broad, occupying about $2 / 3$ of leaf at base and nearly all the leaf near the middle; capsules straight,
 Paraleucobryum longifoliun (Hedw.) Loeske Fig. 57: 1-3 Usually on soil over acidic boulders and cliffs, sometimes on tree trunks, stumps and logs. NF to MB-GR to $A K$, south in the mountains and northern states to GA, TN, MI, WI, MN, SD, NM and AZ.
20. Costae narrow, occupying about $1 / 3$ of leaf at base and usually less above; capsules straight to arcuate,

## DICRANUM

Dicranum flagellare Hedw. Fig. 59: 5-7Commonly on rotting stumps and logs, rarely onhumus or soil over rock. $N F$ to $M B-$ LB to $B C$,
south to FL, AL, LA, SD and MT.
C. Capsules curved, inclined to horizontal;microphyllous branchlets lacking.D
D. Leaves often over 6 mm long, stronglyserrate on margins and back of costa,scarcely crisped when dry; capsuleslong, often over 3 mm , nonstrumose...................................... . scoparium
Dicranum scoparium Hedw. Fig. 58: 1-3
(Broom Moss)
Usually on soil or humus in forests, sometimeson rotting logs and stumps or humus over rock.
$N F$ to $M B--G R$ to $A K$, south to $F L, A L, L A, S D$,
$N M, A Z$ and OR.
D. Leaves usually less than 6 mm long,
weakly serrate, strongly crisped when
dry; capsules short, seldom reaching

Dicranuin fuscescens Turn. Fig. 58: 4-6
Commonly on rotten stumps or logs, sometimes
on bases of trees, soil or humus on banks or
over boulders, rarely in hummocks in bogs.
$N F$ to $M B--G R$ to $A K$, south to $N C$, TN, MI, WI,
$M N, M B, S A, N M, I D$ and CA.
18. Capsules distinctly narrowed at neck that is nearly as long as the urn (especially noticeable when dry); leaves entire ..... 19
18. Capsules not narrowed at neck; leaves entire or serrate. ..... 20
19. Capsules cylindric, strumose, erect to somewhat inclined Trematodon ambiguus
Trematodon ambiguus (Hedw.) Hornsch. Fig. 60: 1-3
(Long-Necked Moss)On predominantly clay soil in open disturbed sites,especially roadside banks and ditches, clearings inwoods, stream banks and fields. NF to ON--LB to ON,south to $\mathrm{NH}, \mathrm{NY}, \mathrm{PA}, \mathrm{MI}, \mathrm{WI}$ and MN ; also in AK and BC .
19. Capsules pyriform, not strumose, horizontal to pendulous. Leptobryum pyriformeLeptobryum pyriforme (Hedw.) Wils. Fig. 60: 4-6
On soil, rock or rotten wood, often in burned-over ordisturbed habitats; common in greenhouses. NF to MB--Throughout most of North America.
20. Leaves with recurved, serrate margins; capsules globose or nearly so..................................................................................... 21
20. Leaves with plane or incurved margins, entire or indistinctly serrate near apex; capsules cylindric. ..... 22
21. Leaves light green, mostly 4 mm long or more, crisped and contorted when dry, base sheathing stem;
common, on noncalcareous rock
Bartramia pomiformis Hedw. Fig. 61: 1-4
(Apple Moss)
On soil or humus over boulders, on cliff ledges or in crevices, often along streams. $N F$ to $M B--G R$ to $A K$, south to GA, AL, AR, OK, MT and OR.
21. Leaves dark green to yellowish green, seldom reaching 4 mm in length, weakly contorted when dry, base not sheathing stem; frequent, on

    calcareous rock.....................................................................Plagiopus oederiana
    
            Plagiopus oederiana (Brid.) Limpr. Fig. 61: 5-8
    
                On calcareous cliffs and boulders, especially along
    
                streams. NF to ON--GR to AK, south to VA, IN, IA,
    
                CO, ID and OR.
    22. Leaves with a V-shaped region of hyaline cells
    at base, dorsal surface with a dull lamina and
    a distinctly shiny costa, many leaves with
    broken tips and missing portions.
                Tortella
    
## TORTELLA

22. Leaves lacking $V$-shaped region of cells and
differentiated lamina and costa, seldom broken............................................... 23

DITRICHUM

```
A. Stems usually tomentose, often over l cm high;
    leaves 2-7 mm long; sporophytes rarely produced;
```

```
            Ditrichum flexicaule (Schwaegr.) Hampe Fig. 63: 1-3
            On calcareous soil or rock, especially on
            bluffs, cliff shelves or in cliff crevices.
            NF to MB--GR to AK, south to NS, VT, MI, MN,
            IA, CO, ID and WA.
```

```
A. Stems not tomentose, seldom reaching 1 cm
    high; leaves 1-2 mm long; sporophytes
```

```
        Ditrichun lineare (Sw.) Lindb. Fig. 63: 4-6
            Frequently on clay, sand or gravelly soil
            banks in wooded clearings, along trails, roads
            or in other disturbed habitats. NF to ON--LB
            to ON, south to FL, TN, IN and AR.
```

23. Peristome teeth lanceolate, capsules usually contracted under mouth when dry Dicranella

## DICRANELLA

A. Capsules strongly contracted under a portion of mouth when dry; setae yellow to brown.............................. ${ }^{\text {. }}$ heteromalla

Dicranella heteromalla (Hedw.) Schimp. Fig. 64: 1-3
On soil banks in woods and along roads, sometimes on hummocks in woods or on soll over stumps and logs, occasionally in rock crevices or soil pockets of boulders especially along streams. NF to MB--NF to MB, south to FL and TX; in the West from AK to CA.
A. Capsules scaracely contracted under mouth when dry; setae red.....................................................................

Dicranella varia (Hedw.) Schimp. Fig. 64: 4-6
On clay or sandy and gravelly soil banks along rivers, roads or in woods. $N F$ to $M B--G R$ to $A K$, south to FL, TN, LA, OK, NM and CA.
24. Alar cells strongly differentiated, inflated

24. Alar cells not noticeably differentiated......................................................... 25
25. Leaves entire or nearly so at apex.................................................................... 26
25. Leaves serrate or toothed at apex.
26. Leaves with a differentiated marginal border of a lighter colour and often thickness than the lamina......................................... 27
26. Leaves lacking differentiated border.............................................................. 28
27. Leaves lanceolate to ovate or oblong-lanceolate, seldom more than 1 mm wide, acute to acuminate,

## BRYUM

A. Plants silvery-white, stems short, $0.4-1.0 \mathrm{~cm}$ high, leaves nondecurrent, costae ending below apices..............B. argenteum Bryum argenteun Hedw. Fig. 65: 1-3

On predominantly dry soil in disturbed habitats, especially
in cracks of sidewalks, along paths, roads and railroads.
NF to MB--Throughout most of North America.
A. Plants green or sometimes brownish or reddish, stems long, $2-6 \mathrm{~cm}$ high, leaves long-decurrent, costae percurrent to

Bryum pseudotriquetrum (Hedw.) Gaertn., Meyer \& Scherb. Fig. 65: 4-6 On wet, often sandy soil or humus beside roads, streams or lakes, sometimes on wet boulders and rock ledges that are frequently calcareous, and occasionally on decayed wood in swamps. NF to MB--GR to $A K$, south to $F L, A L, A R, O K, C O, A Z$ and $C A$.

## RHIZOMNIUM

28. Plants on tree trunks, of ten in small rounded tufts, rarely on fallen trees or rotting logs.................................................... 29
28. Plants on soil, rock, humus, sometimes at bases of
trees and over rotting logs but not on tree trunks............................................... 30
29. Leaves obtuse, margins plane; capsules immersed...................Orthotrichum obtusifolium Orthotrichum obtusifolium Brid. Fig. 67: 4-7

Usually on deciduous tree trunks, especially elm, maple, poplar and willow, rarely on coniferous trunks. NF to MB-LB to $A K$, south to $N C, T N, M I, M N$, NM and CA.
29. Leaves acute, margins recurved; capsules exserted............................................ Ulota

## ULOTA

A. Plants with leaves straight, curved or twisted but not crisped when dry; occurring
on tree trunks and limbs or rock..............................................................
 when dry................................................................
Ulota coarctata (р. Beauv.) Hamm. Fig. 68: 5-8

On tree trunks and limbs. $N F$ to $0 N-$ LB to ON, south to GA, NC and TN.

```
B. Plants on rock; capsules cylindric, without a puckered mouth.............................................. \({ }^{\text {hutchinsiae }}\)
Ulota hutchinsiae (Sm.) Hamm. Fig. 68: 9-11
Usually on noncalcareous rock in forests. \(N F\) to \(O N--N F\) to \(O N\), south to \(G A, A L, A R\) and \(O K\).
```

30. Leaves obtuse (at least the leaves near the
stem tips) to broadly acute............................................................................ 31
31. Leaves acute to acuminate ..... 32
32. Capsules exserted above leaves on a long seta; peristome
teeth filamentous, long and twisted; on soil.....................................Barbula convoluta
Barbula convoluta Hedw. Fig. 69: 1-4
On calcareous soil in open, disturbed habitats, such as roadsides, gravel pits and fields. NF to MB--NF to AK, south to GA, TN, MI, AR, MT and CA.
33. Capsules immersed on a short seta; peristome teeth lanceolate, short and not twisted; on rock in or beside streams or beside ocean.................................................................. Schistidium

## SCHISTIDIUK

A. Leaves ovate-lanceolate, acute or acuminate, rarely narrowly obtuse, often with a hyaline mucro or awnB
A. Leaves ligulate to linear-lanceolate, narrowly obtuse to broadly acute, lacking hyaline tip.......................................... C
B. Leaves usually with a long awn, $1 / 4$ the length of leaf or more, dorsal surface of costa of ten rough near apex...........................................

Schistidium apocarpun (Hedw.) B. \& S. in B.S.G. Fig. 70 : $\overline{\mathbf{1 - 4}}$
On exposed, usually dry, calcareous or noncalcareous rock. $N F$ to $M B--G R$ to $A K$, south to GA, AL, LA, TX, NM, AZ and CA.
B. Leaves lacking awn or awn very short, dorsal surface of costa smooth............................................. riv. rivulare

Schistidium rivulare (Brid.) Podp. Fig. 70: 5-8 On exposed boulders or rock ledges in or beside streams, sometimes in dry woods. NF to ON--GR to AK, south to NC, KY, LA, KS, $N M, A Z$ and CA.
C. Leaf apices narrowly obtuse, sometimes acute, leaves not eroded; maritime plants

            Schistidium maritimum (Turn.) B. \& S. in B.S.G. Fig. 71: 1-3
    
                    On boulders and in cliff crevices in the spray
    
                    zone beside the ocean. NF, NB, NS, QU--Along
    
                the east coast from LB to MA and the west coast
    
                from AK to CA.
            C. Leaf apices broadly obtuse to broadly acute,
            the leaves often eroded; plants not maritime,
                on rocks in or by streams and lakes........................................... . agassizii
            Schistidium agassizii Sull. \& Lesq. ex Sull. Fig. 71: 4-6
                On acidic boulders in or beside streams, often
                near waterfalls. NF to ON--LB to ON, south to
                ME, NY and MI; in the West from \(A K\) and YT,
                south to CA, UT and CO.
            32. Plants nearly julaceous, mostly silvery-white
            due to an absence of chlorophyll in cells....................Bryum argenteum (See p. 86)
            32. Plants neither julaceous nor silvery-white......................................................... 33
    
Weissia controversa Hedw. Fig. 72: 1-3
On soil, soil over rock, or in rock crevices in disturbed,
exposed habitats, especially roadside banks and fields.
NF to MB-NF to AK, south to FL, LA, TX, AZ, NM and CA.
33. Leaf margins recurved or plane when dry. ..... 34
34. Capsules inclined to pendulous, sulcate, ribbed or wrinkled when dry. ..... 35
34. Capsules erect, smooth or ribbed when dry. ..... 37
35. Leafy plants bulbiform; setae flexuose; capsules

        Funaria hygrometrica Hedw. Fig. 72: 4-7
    
        (Cord Moss)
    
            A common weed in disturbed habitats, especially on burned
    
            wood, on soil in roadside ditches, and on soil in
    
            greenhouses. NF to MB--Throughout all of North America.
    35. Leafy plants not bulbiform; setae straight or nearly so; capsules cylindric ..... 36
36. Leaves green, with some red or purple colouration near the base; pseudopodia lacking; capsules and Ceratodon purpureus (Hedw.) Brid. Fig. 73: 1-3An extremely common, weedy species found in disturbedhabitats on soil, rock, wood and humus. NF to MB--
GR to AK, south to NC, TN, AR, TX, NM, AZ and CA.
37. Leaves yellowish green, without red or purple colour; pseudopodia often present with gemmae attached; capsules and setae yellow or brown, sometimes reddish brown....................................................................... Aulacomnium

## AULACOMNIUM

```
A. Medium-sized to robust plants, stems 3-9 cm
    high; pseudopodia present on some plants,
    bearing elongated clusters of leaf-like
    gemmae at apices, often with only naked
```

```
    Aulacomniun palustre (Hedw.) Schwaegr. Fig. 73: 4-8
    (Ribbed Bog Moss)
        On soil or humus, sometimes on rotting logs,
        often in bogs, swamps, at lake margins, beside
        streams or in other wet habitats. NF to MB--
        Throughout Canada and U.S.
    A. Small plants, stems 1-4 cm high; pseudopodia
        with round clusters of gemmae at apices
```

```
        Aulacomnium androgynun (Hedw.) Schwaegr. Fig. 73: 9-11
            Generally in dry habitats, on soil or humus in
            coniferous woodlands, often over rock, sometimes
            on decaying wood. NF to ON--NF to ON, south to
            WV, MI, IL, WI and MN; in the West from AK to
            AT, south to CA, UT and WY.

37. Leaves mucronate, the mucro of $\begin{gathered}\text { yellowish.......................................................... } 38\end{gathered}$
38. Leaves blunt to acute........................................................................................... 40

39. Leaf margins plane............................................................................................ 39
40. Capsules obovate, opercula oblique, calyptrae cucullate, peristome absent; plants on soil, often in open, weedy habitats, such as roadsides, lawns,

Pottia truncata (Hedw.) Fürnr. ex B.S.G. Fig. 74: 1-3
On bare, often calcareous, soil in open, usually disturbed habitats, such as fields, pastures, lawns and roadsides. NB, NS, $\mathrm{QU}, \mathrm{ON}--\mathrm{NS}$ to ON , south to $M D$ and MI; also in $B C$ and WA.
39. Capsules cylindric, opercula straight, calyptrae mitrate, peristome present; plants on rock, usually in woodlands................................................................................Encalypta ciliata

Encalypta ciliata Hedw. Fig. 74: 4-6
(Extinguisher Moss)
On ledges or in crevices of calcareous bluffs or cliffs, sometimes on soil over boulders. NF to MB--GR to ON, south to PA, MI, IA and NE; in the West from AK to YT, south to CA, AZ and NM.
40. Leaf apices sometimes blunt; capsules with 16 ribs, 8 long ones alternating with 8 short ones; occurring on calcareous rock................................................ Orthotrichum anomalum
Orthotrichum anomalum Hedw. Fig. 67: 1-3
Commonly on calcareous rocks. $N F$ to $\mathrm{MB}-\mathrm{LB}$ to AK ,south to $\mathrm{NC}, \mathrm{OH}, \mathrm{IL}, \mathrm{IA}, \mathrm{SD}, \mathrm{NM}, \mathrm{AZ}$ and BC .
40. Leaf apices acute; capsules with 8 ribs of about the same length; occurring on noncalcareous rock .Ulota hutchinsiae (See p. 88)
41. Capsules globose, subglobose or pyriform. ..... 42
41. Capsules cylindric to ovoid. ..... 43
42. Plants large, $3-8 \mathrm{~cm}$ high; capsules inclined, ribbed when dry, peristome present Philonotis fontana
Philonotis fontana (Hedw.) Brid. Fig. 75: 4-7
(Fountain Apple Moss)
On soil, often over rock, in wet places, especially roadside ditches and along streams. NF to MB--GR to AK, south to NC, TN, AR, TX, NM, AZ and CA.
42. Plants small, less than 3 cm high; capsuleserect, smooth or wrinkled at base when dry,
Physcomitrium pyriforme (Hedw.) Hampe ..... Fig. 75: 1-3(Urn Moss)Occurring in the spring on moist, bare, exposed soil,in disturbed habitats, such as stream banks, roadsideditches, lawns, pastures and meadows. NB, NS, QU,ON, MB--NS to AT, south to FL, MS, LA, TX and CO.
43. Leaves with a differentiated border, the border of
a lighter colour and often thicker than the lamina. ..... 44
43. Leaves lacking differentiated border. ..... 47
44. Leaves with hyaline, irregularly toothed border in upper part of leaf............................................................ 94 )
44. Leaves without a hyaline border ..... 45
45. Leaves crowded at stem apices forming rosettes;
plants connected by subterranean stems............................................................
Rhodobryum ontariense (Kindb.) Kindb. Fig. 76: 4-6On humus, rotting logs, bases of trees and soil, oftenover limestone. $N F, N B, N S, Q U, O N-N F$ to $O N$, south toNC, TN, AR, OK and AZ; also in AT.
45. Leaves not crowded into rosettes and plants not connected by subterranean stems ..... 46
46. Leaf borders with teeth in pairs; costae red, especially near base of leaves; stoloniferous shoots absent ..... Mnium
MNIUM
A. Leaf margins without differentiated borderof cells, singly serrate or a few teeth in
Mnium stellare Hedw. Fig. 76: 1-3
On soil over rock, sometimes limestone, on
banks and on bases of trees. NF, NB, NS, QU,
ON--NF to ON, south to NC, TN and AR.
A. Leaf margins with differentiated border
of cells, doubly serrate........................................................................

Mnium ambiguum H. Müll. Fig. 77: 4-6
On soil on bluffs and cliffs, often sandstone
and limestone, and on bases of conifers. NF,
PE, $\mathrm{QU}, \mathrm{ON}, \mathrm{MB}-\mathrm{LB}$ to AK and BC , south to NC ,
MI, AR and NM.
B. Costae smooth on dorsal surface.
.C
C. Leaves scarcely reaching 1.5 mm wide;
plants seldom with sporophytes; peristome
teeth yellow to light brown....................................................... marginatum
Mnium marginatum (With.) Brid. ex P. Beauv. Fig. 77: 1-3
On soil, frequently over calcareous bluffs and
cliffs, sometimes on humus and bases of trees.
NF, NB, NS, QU, ON--LB to AK, south to NC, TN,
$A R, C O, A Z$ and $O R$.
C. Leaves often over 1.5 mm wide and up to
3 mm wide; plants usually with sporophytes;
peristome teeth red to purplish brown........................................... spinulosum
Mnium spinulosum B.S.G. Fig. 78: 1-3
On humus, rotten logs and stumps, bases of trees,
sometimes on sandstone. NB, NS, PE, QU, $\mathrm{ON}, \mathrm{MB}-$
LB to AK, south to MD, MI, WI, MN, CO and WA.
46. Leaf borders with single teeth; costae yellow
or green; stoloniferous shoots present.................................................. Plagiomnium

## PLAGIOMNIUM

A. Leaves obovate, margins toothed to middle............................... cuspidatum
Plagiomnium cuspidatum (Hedw.) Kop. Fig. 78: 4-6
On soil, humus, rocks, bases of trees, rotten logs and stumps in woodlands. NF to $\mathrm{MB}-\mathrm{LB}$ to $A K$, south to $F L, M S, L A, T X, C O, A Z$ and $O R$.
A. Leaves elliptic, margins toothed nearly to base......................................
B. Plants with sporophytes solitary in the perichaetia; occurring in moderately
dry habitats........................................................................................ ciliare
Plagiomnium ciliare (C. Miill.) Kop. Fig. 79: 1-4
On soil, humus, rocks, bases of trees, rotten
logs and stumps in woodlands. NF to MB--LB to AK, south to FL, AL, LA, TX and MT.
B. Plants with sporophytes clustered (1-4) in the perichaetia; occurring in swampy or wet habitats........................................................................ medium

On soil, humus, rocks, often in wet
depressions in woods. NF to MB--GR to
$A K$, south to $T N, A R, C O, A Z$ and $C A$.
47. Leaves broad, often over 3 mm wide.............................................................. Pseudobryum cinclidioides (Hüb.) Kop. Fig. 80: 5-7 On soil or humus in swamps or in wet depressions in woodlands, sometimes on boulders or exposed tree roots. NF to MB--GR to AK, south to VA, MI, MN and MT.
47. Leaves narrow, less than 3 mm wide.

48. Leaves ending in a long hyaline point or awn;
capsules cylindric, erect, immersed or exserted. ..... 49
49. Leaves without hyaline point or awn; capsules cylindric to ovoid, erect to pendulose, exserted. ..... 51
50. Hyaline points long, often reaching 1 mm or more;
peristome with a basal tube and twisted teeth above............................Tortula ruralis Tortula ruralis (Hedw.) Gaertn., Meyer \& Scherb. Fig. 80: 1-4
On soil or rocks in dry, sunny, calcareous habitats, often on sand near shores of lakes. NF, NS, QU, $O N, M B-$ GR to $A K$, south to $N Y, M I, M O, S D, N M, A Z$ and CA.
51. Hyaline points short, usually less than 1 mm or if longer, the margins toothed below the point; peristome without basal tube and teeth not twisted.50
52. Plants with short, tuft-like branches;
capsules exserted
Rhacomitrium

## RHACOMITRIUM

A. Leaves with an obtuse, nonhyaline apex....................................... aciculare

Rhacomitrium aciculare (Hedw.) Brid. Fig. 82: 1-3
On sandy soil over rock in or beside streams and lakes. NF, NB, NS, QU, $\mathrm{ON}--\mathrm{LB}$ to ON , south to GA and TN; in the West from AK to $B C$, south to $C A, I D$ and MT.
A. Leaves with an acute, hyaline apex. . $B$

```
B. Hyaline leaf apices entire or indistinctly
    toothed; plants yellowish green above,
```

```
            Rhacomitrium heterostichum (Hedw.) Brid. Fig. 82: 4-6
                On sandy soil on mainly acidic boulders and
                cliffs, often beside streams and lakes. NF,
                NB, NS, QU, ON--LB to ON, south to GA, TN,
                MI and MN; in the West from AK to AT, south
                to CA, ID and CO.
                B.`Hyaline leaf apices distinctly toothed;
        plants yellowish green to grayish green
        above, light brown to blackish below.
```

C. Hyaline leaf apices extending down margins as decurrencies, strongly toothed; plants grayish green......................................................................... lanuginosumRhacomitrium lanuginosum (Hedw.) Brid. Fig. 81: 1-3(Woolly Fringe Moss)
On dry, exposed, acidic soil or rock. NF, NS, QU,
ON, MB--GR to AK, south to NH, NY, MT, ID and CA.
C. Hyaline leaf apices not extending down
margins as decurrencies, weakly toothed;

Rhacomitrium canescens (Hedw.) Brid. Fig. 81: 4-5
In exposed habitats on sandy soil over rock or on
sand or gravel beside lakes. NF, NB, NS, QU, ON,
MB--GR to $A K$, south to $\mathrm{NH}, \mathrm{NY}, \mathrm{MI}, \mathrm{CO}, \mathrm{ID}$ and CA.
50. Plants with unbranched stems or with long branches; capsules immersed ..... Schistidium (See p. 88)
51. Plants with a whitish, filamentous or cobwebby
substance on leaves...................................................................
Saelania glaucescens (Hedw.) Bomanss. \& Broth. Fig. 83: 1-5 Saelania glaucescens (Hedw.) Bomanss. \& Broth. Fig. 83: 1-5 On soil on steep banks or in rock crevices. NF, NB, NS, QU, $O N, M B--G R$ to $A K$, south to $N Y, M I, M N, I A, C O, A Z$ and $B C$.
51. Plants lacking whitish substance on leaves. ..... 52
52. Leaf margins recurved ..... 53
52. Leaf margins plane or incurved ..... 56
53. Capsules sulcate or ribbed when dry ..... 54
53. Capsules smooth or indistinctly wrinkled ..... 55
54. Leaves often reddish or purplish, especially at base; pseudopodia lacking; capsules and 
54. Leaves green to yellowish brown; pseudopodia often present with gemmae attached; capsules and setae yellow or brown, sometimes reddish brown ..... Aulacomnium (See p. 90)
55. Gametophytes large, often over 1 cm high, leaves broad, 0.5 mm or more wide; on rock in or beside 
55. Gametophytes small, mostly less than 1 cm high,leaves narrow, less than 0.5 mm wide; in varioushabitats, on soil, wood or rock...............................Bryoerythrophyllum recurvirostrumBryoerythrophyllum recurvirostrum (Tayl.) Chen Fig. 83: 6-8Commonly on calcareous soil over boulders and cliff ledges,sometimes on rotten logs and stumps. NF, NB, NS, QU, ON--GR to $A K$, south to $N J, N C, M I, A R, T X, N M, A Z$ and $C A$.
56. Stems and costae red, leaves bluish-green. ..... Mnium stellare (See p. 92)
56. Stems and costae not red, leaves not bluish-green. ..... 57
57. Leaves often 5 mm long or more, margins inrolled when dry; calyptrae remaining attached to setae

Timmia negapolitana Hedw. Fig. 84: 1-3
On moist soil or humus, on shaded banks along creeks or in swamps. NS, QU, $O N, M B--N S$ to $A K$, south to VA, MI, IL, AR, KS, SA, AT and BC.
57. Leaves less than 5 mm long, margins plane; calyptrae not remaining attached to setae ..... Pohlia

## POHLIA

A. Plants yellowish green to dark green;

Pohlia nutans (Hedw.) Lindb. Fig. 84: 4-6
On soil, humus, rotten logs and stumps in clearings in woodlands, sometimes in bogs. NF to MB--GR to $A K$, south to $G A, A R, K S, C O, A Z$ and $C A$.

A. Plants whitish green; leaf margins plane; capsules
elongate or short and nearly as broad as long............................................
B. Leaves glossy, often with opalescent

Pohlia cruda (Hedw.) Lindb. Fig. 85: 1-3
On soil or humus, often on shaded rock ledges or in crevices of cliffs, sometimes on rotten logs. NF to $M B--G R$ to $A K$, south to $T N, M I, I A, C O, A Z$ and $C A$.
B. Leaves dull, lacking opalescent patches;

Pohlia wahlenbergii (Web. \& Mohr) Andr. Fig. 85: 4- $\overline{6}$
On soil in exposed and disturbed habitats,
sometimes beside streams. NF to MB--GR to
$A K$, south to $N C, T N, A R, N E, N M, A Z$ and $C A$.
58. Leaves strongly rugose when dry, falcate-secund, margins recurved.

Rhytidium rugosum
Rhytidiun rugosun (Hedw.) Kindb. Fig. 86: 1-3
On dry, exposed, calcareous rocks and cliffs. NF, NS, QU,
$O N, M B--G R$ to $A K$, south to $N C, T N, M O, S D, C O$ and $A Z$.
58. Leaves not rugose............................................................................................ 59
59. Plants complanate, leaves appearing distichous, oblong, falcate, apices rounded....................................................................

Homalia trichomanoides (Hedw.) B.S.G. Fig. 86: 4-6
On calcareous rock ledges, bluffs, shaded faces of cliffs' and occasionally on bases of trees. NF to ON--LB to ON, south to $N C, M S$ and $A R$; also in $B C$, WA, $O R$ and $A Z$.

59. Plants not complanate or if so, leaves not oblong
with rounded apices.
.60
60. Leaves with a single costa.............................................................................. 61
61. Leaves lacking costa or costa double (usually divided at base).84
62. Plants dendroid and erect ..... 62
63. Plants not dendroid ..... 63
64. Branches covered with paraphyllia that give them a whitish or brownish cobwebby appearance; plants on humus in wet, of ten swampy habitats........................Climacium dendroides Climaciun dendroides (Hedw.) Web. \& Mohr Fig. 87: 1-4 (Tree Moss)
On wet soil and humus in swamps, along streams, beside pools in woods and on shady, damp rocks. NF to MB--GR to AK, south to VA, IL, MN, NM, AZ and CA.
65. Branches lacking paraphyllia; plants on rock
and not in swampy habitats .....  Thamnobryum alleghaniense
Thannobryum alleghaniense (C. Mü11.) Nieuw1. Fig. 87: 5-7
On wet rock ledges beside creeks and on humus overrock. NB, NS, QU, $O N--N S$ to $O N$, south to GA, AL,MS and AR.
66. Apices of many branches with clusters of
microphyllous branchlets. ..... Leskeella nervosa
Leskeella nervosa (Brid.) Loeske Fig. 88: 1-3
On tree trunks, rotten logs and calcareous rocks. NF, NB,NS, QU, $O N, M B--G R$ to $A K$, south to $N C, P A, M I, M N, N M$ and $A Z$.
67. Apices of branches lacking clusters ofmicrophyllous branchlets.64
68. Stems pinnate to tripinnately branched, sometimes
frondose; stems and branches covered with paraphyllia (white, green, yellow or brown in colour with a hairy, granular or cobwebby appearance) ..... 65
69. Stems irregularly branched or rarely pinnately branched but never frondose; paraphyllia
lacking or not evident (rhizoids sometimes present which somewhat resemble paraphyllia but they occur only on the main stem) ..... 66
70. Stems l-pinnate, with a cobwebby apearance caused by a dense covering of long paraphyllia; plants of wet habitats, especially swampy cedar woods Helodium blandowii
Helodium blandowii (Web. \& Mohr) Warnst. Fig. 88: 4-6
In calcareous swamps, fens and pools in woods. NF to MB-- GR to AK, south to NY, OH, MI, WI, MN, CO, AZ and WA.
71. Stems $1-3$ pinnate, with a hairy or granular appearancedue to short paraphyllia; plants often in dry habitats.Thuidium
THUIDIUM
(Fern Moss)
A. Plants l-pinnate abietinum
Thuidium abietinum (Hedw.) B.S.G. Fig. 89: 1-4 On dry, exposed, calcareous rocks and cliff shelves, on humus on slopes, and on rotten stumps. NF, NB, NS, QU, ON, MB--GR to AK, south to VA, IN, IA, SD, CO and AZ.
A. Plants 2- or 3-pinnate .....  $B$
B. Stem leaves arched and standing out from stem when dry; usually on calcareous substrata................... T. recognitum
Thuidium recogaitum (Hedw.) Lindb. Fig. 89: 5-7
On calcareous soil, humus, boulders and
sometimes on bases of trees in woods. NF
to $M B--L B$ to $A K$, south to $G A, T N, A R, O K$,
MT and BC.
B. Stem leaves appressed or slightly spreading from stem when dry; usually on acidic substrata............................................................. delicatulum
Thuidium delicatulum (Hedw.) B.S.G. Fig. 90: 1-3
Usually in wet habitats on acidic substrata, such as humus, soil, boulders, rotten logs and stumps in woods. NF to MB--LB to AK, south to $\mathrm{FL}, \mathrm{AL}, \mathrm{LA}$ and TX ; also in AZ .
72. Margins of stem and branch leaves ciliate
Thelia hirtella
Thelia hirtella (Hedw.) Sull. Fig. 90: 4-6

On bases of deciduous trees. NB, NS, QU, ON--Southern
NS to southern ON, south to FL, MS, LA and TX.

66. Margins of stem and branch leaves not ciliate
67. Stems much branched, covered with a mat of brown rhizoids that are lacking on branches; plants of

Tomenthypnum nitens (Hedw.) Loeske Fig. 91: 1-4
In calcareous swamps and fens. NF, NB, NS, QU, ON, MB-GR to AK, south to NJ, PA, MI, WI, MN, CO and WA.
68. Stems irregularly branched or if subpinnately
branched, with few or no rhizoids; plants of
various habitats. ..... 68
69. Leaves squarrose Campylium chrysophy11um
Campylium chrysophyllum (Brid.) J. Lange Fig. 91: 5-8 On calcareous or noncalcareous rocks and soil, rotten wood and bases of trees. NF to MB--LB to YT, south to FL, LA, TX and AZ.
70. Leaves not squarrose. ..... 69
71. Stem leaves with an obtuse apex, often broad and entire ..... 70
72. Stem leaves with an acute apex. ..... 71
73. Plants of wet habitats (bogs, swamps, fens, etc.). ..... Calliergon

## CALLIERGON

A. Leaves appressed throughout the stems; costae reaching $3 / 4$ the length of the leaves........................................................................... $\underline{C}$. stramineum
Calliergon stramineum (Brid.) Kindb. Fig. 93: 1-3
In bogs, fens, at margins of lakes and in shallow pools. NF to MB--GR to AK, south to NY, MI, WI, CO, MT and OR.
A. Leaves spreading or often appressed only
at stem and branch apices; costae
percurrent or ending just below apices.....................................................
B. Stems irregularly branched with few
branches; stem leaves narrow, clearly

Calliergon cordifoliun (Hedw.) Kindb. Fig. 93: 4-7
In bogs, swamps, drainage ditches and wet
depressions. NF to $M B--G R$ to $A K$, south in
the mountains and northern states to NC,
TN, MI, IL, IA, CO, ID and WA.
B. Stems often pinnate with numerous
branches; stem leaves broad, sometimes
nearly as broad as long........................................................... giganteum
Calliergon giganteum (Schimp.) Kindb. Fig. 94: 1-3
In bogs, fens, swamps, shallow pools, ponds,
and near springs. $N F$ to $M B--G R$ to $A K$, south
to NY, PA, MI, WI, MN, CO, ID and WA.
70. Plants of dry habitats, always on limestone.......Anomodon viticulosus (See p. 100)
71. Leaves strongly falcate-secund, especially at stem and branch tips ..... 72
71. Leaves not falcate-secund. ..... 74
72. Leaves short, seldom over 1 mm long...............Brachythecium velutinum (See p. 101)
72. Leaves long, mostly over 1 mm long. ..... 73
73. Leaves acute to short-acuminate, some narrowlyobtuse, smooth; perichaetial leaves long andsheathing, nearly reaching capsule; on bases oftrees, shrubs and rocks beside streams......................................... Dichelyma pallescens
Dichelyma pallescens B.S.G. Fig. 98: 1-3In periodically flooded places at margins of ponds andlakes on rocks and branches and bases of bushes andtrees. $N F, N B, N S, Q U, O N--N F$ to $O N$, south to $N Y, M I$,WI and MN.
73. Leaves long-acuminate; stem leaves sometimes plicate; perichaetial leaves short and not sheathing setae; often in swamps, fens and bogs or sometimes in woodlands on rock, wood or humus. ..... -Drepanocladus

## DREPANOCLADUS

(Hooked Moss)
A. Stem and usually branch leaves plicate; plants green or yellowish green................................................ ${ }^{\text {. }}$. uncinatus

Drepanocladus uncinatus (Hedw.) Warnst. Fig. 98: 4-7
In coniferous woods on bases of trees, humus, rotten logs, stumps and rocks or occasionally in wet meadows and drainage ditches. $N F$ to $M B--G R$ to $A K$, south to NY, PA, OH, MI, MN, NM, AZ and CA.
A. Stem and branch leaves smooth; plants
often tinged with red or purple............................................................
B. Costae extending $3 / 4$ or more the length
of the leaves.............................................................. ex. exannulatus
Drepanocladus exannulatus (B.S.G.) Warnst. Fig. 99: $\overline{\mathbf{1}}-4$
Often submerged in bogs, swamps, meadows,
wet depressions and drainage ditches. NF
to MB--GR to AK, south to NJ, NY, PA, MI,
WI, CO, UT and CA.
B. Costae extending to middle of leaves,
rarely beyond................................................................ ${ }^{\text {fluitans }}$
Drepanocladus fluitans (Hedw.) Warnst. Fig. 99: 5-7
In bogs, swamps, wet depressions and at
margins of streams and lakes. NF to MB--
GR to AK , south to VA, $\mathrm{IN}, \mathrm{MN}, \mathrm{CO}$ and CA.
74. Plants on rock, usually in streams ..... 75
74. Plants on various substrata and if on rock, not in streams ..... 78
75. Stems often with a wiry appearance, the basal part of the stem with only the remnants of costae attached; leaves narrow, less than 1 mm wide. ..... 76
75. Stems without wiry appearance, the entire leaves intact; leaves broad, often 1 mm wide ..... 77
76. Leaves with a differentiated marginal border of a different colour and thickness than the rest of the leaf ..... Sciaromium lescurii
Sciaromium lescurii (Sull.) Broth. ..... Fig. 100: 1-4
On rocks and boulders in waterfalls, creeks and rivers. $N F, N S, O N, Q U--N F$ to $O N$, south to $G A, A L$ and AR.
76. Leaves without differentiated marginal border. .Hygroamblystegium tenax
Hygroamblystegium tenax (Hedw.) Jenn. Fig. 100: 5-8 On calcareous and noncalcareous boulders, rock ledges and bluffs or rarely woody debris in creeks and rivers. NF to MB--NF to $B C$, south to FL, AL, LA, TX, NM, AZ and CA.
77. Leaves decurrent Brachythecium rivulare (See p. 101)
77 . Leaves nondecurrent ..... Hygrohypnum ochraceum
Hygrohypnum ochraceum (Turn. ex Wils.) Loeske Fig. 101: 1-4
On soil over acidic rocks in and beside creeks, streamsand waterfalls, sometimes beside lakes. NF to ON-GRto $O N$ and $M N$, south in the mountains to $N C$ and $T N$; inthe West from AK to NT, south to CA, MT and CO.
78. Leaves long in relation to width, 7-15 times as long as wide; plants usually in aquatic

    habitats, such as swamps, creeks and rivers........................... Leptodictyum riparium
    
        Leptodictyum riparium (Hedw.) Warnst. Fig. 101: 5-8
    
            On rocks and boulders (sometimes calcareous) in and
    
            beside creeks and rivers; also on fallen branches
    
            and woody debris in swamps and stagnant pools. NF
    
            to MB--LB to YT, south to FL, LA, TX, NM, AZ and CA.
    78. Leaves short in relation to width, mostly less than 7 times as long as wide; plants mostly of dry or mesic habitats. ..... 79
79. Leaves dull when dry, costa bulging on dorsal leaf surface and of a different colour than lamina ..... 80
80. Leaves glossy when dry, costa similar in colour to lamina ..... 82
81. Leaves acute to nearly obtuse..................................................... Leskea polycarpa
Leskea polycarpa Hedw. Fig. 102: 1-4 On bases of trees or decaying logs, often in periodically flooded places. NB, NS, QU, ON, MB-- NS to MB, south to NC, AL, MS, LA and NE; also in BC.
82. Leaves ending in an apiculus or a long, hyaline hair point ..... 81
83. Leaves (at least many) with a long, hyaline, often toothed apex ..... Rhacomitrium (See p. 93)
84. Leaves apiculate or with a long, smooth hair point ..... Anomodon
ANOMODON

A. Leaves with a long-filiform, hyaline

    acumen; leaf margins revolute.................................................... \(\underline{\text { r }}\) rostratus
    
            Anomodon rostratus (Hedw.) Schimp. Fig. 94: 4-6
    
                On rocks and in cliff crevices that are
    
                frequently calcareous, on bases of trees and
    
                sometimes on soil and humus. NF, NB, NS, QU,
    
                ON, MB--NF to SA, south to FL, LA, TX, NM and AZ.
    A. Leaves apiculate, acute or obtuse; leaf

        margins plane .....  B
    B. Plants with attenuate branches (especially noticeable when dry); branch leaves gradually narrowed to an acute apex, scarcely contorted when dry; occurring on tree trunks and calcareous and noncalcareous rock............................................ attenuatus

            Anomodon attenuatus (Hedw.) Hib. Fig. 95: 1-5
    
                On tree trunks, bases of trees, rotten stumps
    
                and calcareous and noncalcareous rocks and
    
                cliff shelves. NF to MB--NF to MB, south to
    
                    FL, LA, TX, NM and AZ.
    
            B. Plants without attenuate branches; branch
    
                leaves obtuse or apiculate, strongly contorted
    
                when dry; occuring on calcareous rock...................................... viticulosus
    
            Anomodon viticulosus (Hedw.) Hook. \& Tayl. Fig. 95: 6-8
    
                    On calcareous rocks and cliff ledges, rarely
    
                    on tree trunks. \(N B, N S, O N, Q U--N S\) to \(O N\),
    
                    south NY, TN and AR.
        obtuse, strongly serrate, not twisted.................................Eurhynchium pulchellum
    Eurhynchium pulchellum (Hedw.) Jenn. Fig. 102: 5-9
On soil, rotten stumps and logs, bases of trees, rock outcrops and on humus over rock. NF to MB-GR to AK, south to GA, LA, TX, NM, AZ and CA.
82. Branch leaves narrow at apex, acute to
acuminate, sometimes twisted............................................................................. 83
83. Stem leaves smooth, nearly as broad as long, apex
often abruptly narrowed, acute and twisted.................................Bryhnia novae-angliae Bryhnia novae-angliae (Sull. \& Lesq. ex Sull.) Grout Fig. 103: 1-5

On soil, rocks, humus and rotten logs in wet shady places, especially along creeks. NF to $O N--N F$ to $O N$ and WI, south in the mountains to NC, TN and GA; also in MO, AR and CA.
83. Stem leaves often plicate, usually longer than broad, apex usually gradually narrowed, acuminate,

## BRACHYTHECIUM

B. Leaves falcate-secund; stem leaves shortdecurrent, margins plane or recurved at base........................B. velutinum Brachythecium velutinum (Hedw.) B.S.G. Fig. 97: 5-8

Mainly in rather dry habitats on soil, often
over rock, and on bases of trees. NF to MB-LB to BC , south to $N Y, \mathrm{MI}, \mathrm{MN}, \mathrm{WY}, \mathrm{UT}$ and CA.
B. Leaves straight or nearly so; stem leaves long-decurrent, margins recurved to leaf middle or above.......................................................... reflexum

Brachythecium reflexum (Starke ex Web. \& Mohr) B.S.G. Fig. 97: 1-4

Usually in dry woods, on bases of trees, rotten
logs and stumps and humus over rocks. NF to
MB--GR to AK, south to VA, MI, WI, MN and OR.
C. Leaves smooth or plicate, stem leaves longdecurrent; setae rough; occurring in wet habitats in and beside creeks, rivers, springs, etc................................... rivulare

Brachythecium rivulare B.S.G. Fig. 96: 1-3
On soil, rocks and logs in and beside creeks, rivers, springs and seepy places. NF to MB-LB to $A K$, south to $N C, A R, N M, A Z, N V$ and $W A$.
C. Leaves plicate, stem leaves short-decurrent; setae smooth; occurring in dry to mesic habitats..................... . salebrosum Brachythecium salebrosum (Web. \& Mohr) B.S.G. Fig. 96: 4-6 Usually in dry, disturbed habitats on rock, soil, humus, rotten stumps and logs and bases of trees. $N F$ to $M B--G R$ to $A K$, south to $N C, T N, L A, T X, C O, A Z$ and CA.
84. Plants aquatic, in flowing water of streams;

## FONTINALIS <br> (Water Moss)

```
        A. Leaves keeled; plants often yellowish to
```

```
            Fontinalis antipyretica Hedw. Fig. 103: 6-8
                On boulders and twigs in creeks and ponds.
                NF, NB, NS, QU, ON, MB--GR to AK, south to
                PA, MI, WI, MN, NM, AZ and CA.
```

A. Leaves concave; plants usually green to brownish. $B$
B. Leaves broad, 2-3 times as long as wide, the margins plane when dry.................................................. novae-angliae

Fontinalis novae-angliae Sull. Fig. 104: 1-3 On rocks in flowing water in creeks and rivers or at margins of lakes. NF, NB, NS, QU, $\mathrm{ON}, \mathrm{MB}--N F$ to $M B$, south to FL , LA and OK .
B. Leaves narrow, 3-5 times as long as wide, the margins sometimes reflexed when dry.............................. dalecarlica

Fontinalis dalecarlica Schimp. ex B.S.G. Fig. 104: 4-8 On rocks, branches and logs in running water of creeks and rivers. $N F, N B, N S, Q U, O N$, MB--GR to AT, south to FL, TN, WI and MN.
84. Plants not aquatic.................................................................................................. 85
85. Leaves with whitish tips, those surrounding immersed capsules with cilia on margins; eperistomate; on

Hedvigia ciliata (Hedw.) P. Beauv. Fig. 105: 1-4
On dry, exposed, usually acidic boulders and cliffs. NF, NB, NS, QU, ON, MB--GR to AK, south throughout most of the United States.
85. Leaves lacking whitish tips and cilia; peristomate; on various substrates 86

86. Stems and branches with clusters of
microphyllous branchlets in leaf axils. ..... 87
87. Stems and branches lacking clusters of microphyllous branchlets in leaf axils................................................................ 89
88. Leaves distant, wide-spreading, stems and branches
of ten visible between leaves; on soil or rock............................. Isopterygium elegans
Isopterygium elegans (Brid.) Lindb. Fig. 105: 5-8
On soil and humus on banks and cliffs in moist woodlands. NF to $\mathrm{ON}-\mathrm{LB}$ to ON , south to $\mathrm{SC}, \mathrm{GA}$, TN and AR; in the West from $A K$ to $B C$, south to CA.

[^1]88. Leaves smooth, branches straight when dry;of ten with sporophytes................................................
Platygyrium repens (Brid.) B.S.G. Fig. $106: 1-5$On tree trunks, rotten logs and stumps. $N F$ to $M B--N F$to MB , south to $\mathrm{FL}, \mathrm{AL}, \mathrm{LA}$ and OK ; also in $\mathrm{BC}, \mathrm{AT}$ and SA .
88. Leaves plicate, branches curved when dry; never with sporophytes................................. Leucodon brachypus var. andrewsianus
Leucodon brachypus var. andrewsianus Crum \& Anders. Fig. 106: 6-9
n tree trunks, rotten logs or sometimes on rock.$N F$ to $O N--N F$ to $O N$, south to $N C, T N$ and $M I$.
89. Stems and branches covered with long, branched, white, yellow, or green paraphyllia giving them a cobwebby appearance; stems often frondose, 1-3 pinnate.......................................................

## HYLOCOMIUM

A. Stems regularly branched, 2-3 pinnate; stem leaves usually with a long, slender,
 Hylocomiun splendens (Hedw.) B.S.G. Fig. 107: 1-5 (Stair-Step Moss)
On humus, rotten logs, soil and rocks in swamps and forests. $N F$ to $M B--G R$ to $A K$, south to $N C$, GA, TN, MI, IA, SD, CO, ID and CA.
A. Stems irregularly branched, l-2 pinnate; stem
leaves broadly acuminate and not undulate................................... umbratum Hylocomium unbratum (Hedw.) B.S.G. Fig. 107: 6-10 On rotten wood and humus over rocks in forests. NF to $\mathrm{ON}-\mathrm{L} \mathrm{LB}$ to ON , south in the mountains and northern states to NC, TN and MI; also in AK and BC.
89. Stems and branches lacking paraphyllia ..... 90
90. Plants julaceous ..... 91
90. Plants not julaceous ..... 97
91. Plants pinnately branched. ..... 92
91. Plants irregularly branched ..... 94
92. Plants small, stem leaves acuminate, seldom

Heterocladium dimorphum (Brid.) B.S.G. Fig. 108: 1-5
On soil and humus banks, bases of trees and boulders in moist woods. $N F$ to $O N--L B$ to $O N$, south to $N Y$ and MI; in the West from AT to YT, south to MT and OR.
92. Plants robust, stem leaves apiculate, often
1 mm long or more ..... 93
93. Stems and branches orange or red ..... Pleurozium schreberi
Pleuroziun schreberi (Brid.) Mitt. Fig. 108: 6-10 (Red-Stemmed Feather Moss)
On humus and soil in woods, occasionally in bogs,

```
sometimes occurring on stumps. NF to MB--GR to AK,
south to NC, TN, AR, SD, CO, ID and OR.
```

```
Calliergonella cuspidata (Hedw.) Loeske Fig. 109: 1-5
A calciphile occurring in swamps, fens and alkaline bogs.
NF to ON--NF to AK, south to NC, TN, MI, MN, WY, ID and CA.
94. Plants large, stem leaves often 1 mm long................................................................
94. Plants small, stem leaves less than 1 mm long......................................................}9
95. Leaves often short to long-acuminate, contorted when dry, stems often visible between leaves; on soil or humus over rock, sometimes over bases of trees and rotten wood .Plagiothecium
```

Capsules, operculate (wet) and inoperculate (dry) ( x 9 ). 6-9, Pylaisiella polyantha. 6. Habit ( x 4 ). 7. Portion of branch (x18). 8. Branch leaves (x36). 9. Capsules, operculate (wet) and inoperculate (dry) (xl8).

Acrocarpous -- mosses possessing erect, simple or sparsely branched gametophytes that grow in tufts and produce sporophytes at the end of a stem or main branch (e.g., Tetraphis).

Acumen -- a slender, tapering point.
Acuminate -- slenderly tapered. (Fig. 121: 1)
Acute -- sharply pointed (less than $90^{\circ}$ ). (Fig. 121: 2)
Alar Cells -- cells at the basal angles of a leaf, often differentiated in shape, size or colour. (Fig. 121: 18)

Amphigastria -- a row of rudimentary leaves on the ventral side of the stem; underleaves. (Fig. 128: 100)

Annulus -- a ring of differentiated cells between the mouth of the capsule and the operculum, aiding in dehiscence. (Fig. 126: 73)

Antheridium (pl. Antheridia) -- the male reproductive organ, a globose to cylindric, stalked structure producing sperms. (Fig. 126: 70)

Antheridiophore -- the elevated male structure of certain thalloid liverworts, consisting of a disk and stalk arising from the thallus. (Fig. 127: 90)

Apiculate -- abruptly short-pointed. (Fig. 121: 4)
Apiculus -- a short, abrupt point. (Fig. 121: 4)
Appressed -- lying close together; closely applied to the stem. (Fig. 124: 50)
Archegonium (pl. Archegonia) -- the female reproductive organ, a flask-shaped structure producing an egg. (Fig. 126: 72)

Archegoniophore -- the elevated female structure of certain thalloid liverworts, bearing groups of archegonia. (Fig. 127: 91)

Arcuate -- curved like a bow. (Fig. 126: 78)
Asexual -- involving no sexual action; also possessing neither male nor female organs.
Asymmetric -- not symmetrical.
Attenuate -- narrowly tapered. (Fig. 124: 49)
Auriculate -- with small, ear-like bulges or lobes (auricles) at the basal margins of a leaf. (Fig. 121: 19)

Awn -- a bristle- or hair-point, usually formed by an excurrent costa. (Fig. 121: 3)
Axil -- the upper angle between leaf and stem. (Fig. 122: 26)

Bi- -- a prefix meaning two.
Biflagellate -- with two flagella.
Bilobed -- with two lobes. (Fig. 129: 104)

Bipinnate -- twice-pinnately branched. (Fig. 124: 56)
Bisexual -- having both sexes present.
Border -- margin differentiated from the rest of the leaf in colour or thickness. (Fig. 121: 22)

Bracts -- modified leaves around the reproductive organs; in liverworts, often larger, below the perianth. (Fig. 129: 113)

Bulbiform -- bulb-shaped. (Fig. 124: 57)

Caducous -- deciduous, regularly falling off.
Calcareous -- containing calcium carbonate (e.g., limestone or dolomite rocks).
Calyptra (p1. Calyptrae) -- a membranous hood over the young sporophyte, developed from tissue at the base of the archegonium; in mosses ruptured near the base, carried upward by elongation of the seta, and continuing growth to form a cap over the capsule (Fig. 126: 75-77); in liverworts splitting at elongation of the sporophyte and remaining at its base. (Fig. 129: 113)

Capsule -- the spore case; in mosses often differentiated into an upper spore-bearing urn and a sterile basal portion called the neck (Fig. 126: 73), undifferentiated in hornworts (Fig. 127: 94) and liverworts (Fig. 129: 113).

Cilia (sing. Cilium) -- delicate, hair-like appendages fringing leaves. (Fig. 121: 23)
Ciliate -- fringed with hairy appendages (cilia). (Fig. 121: 23)
Columella -- the central axis of a capsule around which the spores develop. (Fig. 127: 94).
Complanate -- flattened together or compressed in one plane. (Fig. 125: 61)
Complicate-Bilobed -- leaves bilobed, with lobes folded together. (Fig. 129: 109)
Connivent -- with the tips converging, or coming close together. (Fig. 129: 106)
Contorted -- bent into irregular curves, irregularly twisted. (Fig. 122: 32)
Cordate -- heart-shaped. (fig. 121: 12)
Costa (pl. Costae) -- a thickened region of usually elongate cells, either single or double in mosses, single in some thalloid liverworts; midrib. (Fig. 121: 22)

Costate -- with a costa.
Crisped -- irregularly curled and twisted. (Fig. 122: 32)
Cucullate -- hooded or hood-shaped; a cucullate calyptra is conic and split up one side, resembling a monk's hood (Fig. 126: 75); also used to describe leaves concave at the tips. (Fig. 121: 11)

Decurrent -- with the margins extending down the stem below the leaf insertion as ridges or narrow wings. (Fig. 122: 27)

Dendroid -- branched above a trunk-1ike base and resembling a tree. (Fig. 124: 58)
Dentate -- with sharp teeth directed outward. (Fig. 123: 40)

Dichotomous -- equally forked, with paired branches. (Fig. 124: 60)
Distichous -- in two opposite rows. (Fig. 124: 54)
Dorsal -- the back or lower surface (i.e., the surface away from the stem) or the upper surface (i.e., the surface away from the substratum) of a flattened plant body like a thallus. (Fig. 122: 26; 128: 96, 101)

Dorsal Lobe -- the lobe on the upper surface of a plant. (Fig. 129: 109)
Doubly Serrate -- with teeth overlapping and joined in pairs. (Fig. 123: 42)

E- -- a prefix, meaning not, without.
Ecostate -- without a costa. (Fig. 121: 23)
Elaters -- small, unicellular, sterile cells, usually elongated and with spiral thickenings, mixed with the spores in the capsules of liverworts; aiding in spore dispersal. (Fig. 129: 107)

E1liptic -- essentially oblong but convex at sides and ends. (Fig. 121: 20)
Entire -- not at all indented or toothed; with a continuous margin. (Fig. 123: 39)
Eperistomate -- without a peristome.
Erect-Spreading -- spreading at an angle of about $45^{\circ}$ or less. (Fig. 123: 44)
Excurrent -- extending beyond the apex or end of lamina. (Fig. 121: 3)
Exserted -- projecting and exposed, applied to capsules which project beyond the tips of the leaves. (Fig. 127: 88)

Falcate -- curved like the blade of a sickle. (Fig. 122: 34)
Falcate-Secund -- strongly curved and turned to one side. (Fig. 124: 53)
Fascicle -- a small bundle or cluster. (Fig. 125: 64)
Female Bracts -- modified leaves, often larger, below the perianth; also called perichaetial bracts. (Fig. 129: 113)

Filiform -- slender and elongate, filamentous, thread-like.
Flagella (sing. Flagellum) -- whip-like slender branches or stems, leafless or with rudimentary leaves, e.g., Bazzania (Fig. 128: 100); long, whip-like structures controlling the movement of the sperm cell.

Flexuose -- slightly and irregularly bent, twisted, or wavy. (Fig. 122: 33)
Foot -- the basal absorbing organ of the sporophyte. (Fig. 126: 73)
Frondose -- closely and regularly branched in one plane.

Gametophyte -- the dominant, sexual generation which bears the sex organs; the green, leafy or thalloid plant. (Fig. 128: 95-96)

Gemma (pl. Gemmae) -- a small, asexually produced reproductive body, formed of 1-several cells. (Fig. 125: 66; 129: 112)

Gemmae Cup -- small cup-like structure, formed from modified leaves, leafy tissue or thalloid tissue, that contains gemmae. (Fig. 125: 65; 128: 97)

Gemmae Receptacle -- a container with gemmae inside. (Fig. 128: 98)
Gemmiferous -- bearing gemmae.
Globose -- spherical. (Fig. 126: 83)

Hispid -- with short, stiff hairs, bristly. (Fig. 126: 76)
Hyaline -- colourless and transparent.
Hygrophytic -- indicating a plant occurring in wet habitats but not in water.

Imbricate -- closely overlapping. (Fig. 124: 51)
Immersed -- completely covered; immersed capsules are exceeded by the tips of leaves. (Fig. 127: 89)

Inclined Capsule -- less than vertical, between erect and horizontal. (Fig. 126: 79)
Incubous -- leaves of liverworts that are obliquely inserted so the lower leaf overlaps the one above it when viewed from the dorsal surface and toward the stem apex. (Fig. 128: 101)

Inflated -- swollen.
Inflorescence -- a cluster of sex organs and the leaves surrounding them.
Inoperculate -- without operculum.
Involucre -- a short tube or sheath, sometimes formed by an outgrowth of the thallus, forming a protective covering around the archegonia and sporophyte. (Fig. 129: 113)

Julaceous -- smoothly cylindric, like a worm, referring to stems or branches with crowded and imbricate leaves. (Fig. 124: 52)

Keel -- the projecting ridge on the fold of some leaves. (Fig. 122: 29; 129: 109)

Lamellae (sing. Lamella) -- ridges or plates on the costa or lamina of some moss leaves. (Fig. 122: 38)

Lamina (pl. Laminae) -- the expanded part of a leaf or thallus (as distinguished from the costa). (Fig. 121: 22)

Lanceolate -- lance-shaped, narrow and tapered from the base (narrower than ovate). Fig. 121: 16)

Lateral -- on or at the side.
Ligulate -- strap-shaped (longer and narrower than lingulate). (Fig. 121: 13)
Linear -- very narrow and elongate, with nearly parallel sides (narrower than 1igulate). (Fig. 121: 14)

Mesic -- moist, neither very wet nor very dry but intermediate.
Micrometer -- one-thousandth of a millimeter.
Microphyllous Branchlets -- small branches with reduced leaves, serving as asexual reproductive bodies. (Fig. 125: 67)

Mitrate -- conic and undivided or equally lobed at base, referring to calyptrae of mosses (opposed to cucullate or split on one side). (Fig. 126: 77)

Mucro -- a short, abrupt point. (Fig. 121: 6)
Mucronate -- ending abruptly in a short point usually caused by a shortly excurrent costa. (Fig. 121: 6)

Multicellular -- composed of more than one cell.
Multistratose -- composed of more than one layer.

Neck -- the sterile basal portion of a capsule, sometimes considerably differentiated. (Fig. 126: 73)

Oblong -- much longer than broad, with nearly parallel sides. (Fig. 121: 24)
Obovate -- egg-shaped, with the broader portion at the apex rather than the base; the reverse of ovate. (Fig. 121: 25)

Obtuse -- blunt or rounded. (Fig. 121: 8)
Ocelli -- modified leaf cells in some liverworts, often glistening or discoloured, sometimes in groups or lines. (Fig. 129: 110)

Operculate -- with operculum.
Operculum (p1. Opercula) -- the lid covering the mouth of a moss capsule, falling at maturity to release the spores. (Fig. 126: 73)

Oval -- broadly elliptic in outline. (Fig. 121: 17)
Ovate -- egg-shaped in outline (with the base broader than the apex). (Fig. 121: 21)
Ovoid -- an egg-shaped solid. (Fig. 126: 82)

Paraphyllia (sing. Paraphyllium) -- small, filiform, lanceolate, or leaf-like, sometimes branched structures, with a white, yellow, green or rarely brown colour and often cobwebby appearance on stems and branches of some mosses. (Fig. 125: 68)

Paraphyses (sing. Paraphysis) -- hyaline or yellowish, multicellular hairs, sometimes club-shaped, mingled with the antheridia (and often with archegonia). (Fig. 126: 71)

Pendulous -- somewhat drooping, more inclined than horizontal. (Fig. 126: 80)
Percurrent -- extending to the apex. (Fig. 121: 5)

Perianth -- a tubular sheath formed of 2-3 leaves that surrounds the archegonia and sporophyte. (Fig. 129: 113)

Perichaetia (sing. Perichaetium) -- female inflorescences, comprised of leaves surrounding the archegonia.

Perichaetial Leaves -- the leaves surrounding the archegonia.
Peristome -- a single or double circle of teeth inside the mouth of the capsule of mosses; aiding in spore dispersal. (Fig. 126: 74)

Peristomate -- with a peristome.
Pinnate -- with numerous, spreading branches on two sides of the axis and thus resembling a feather. (Fig. 124: 55)

Plane -- flat.
Pleurocarpous -- mosses possessing prostrate, freely branched gametophytes that grow in mats and produce sporophytes laterally from the main stem (e.g., Hylocomium).

Plicate -- folded in longitudinal pleats. (Fig. 122: 35)
Plumose -- closely and regularly pinnate, feathery. (Fig. 125: 62)
Postical -- below or behind; pertaining to the under (rhizoid-bearing) surface of a stem or the lower margin of a leaf.

Primary Stem -- the main stem, often creeping or rhizome-like with reduced or scale-like leaves.

Prostrate -- creeping.
Protonema (pl. Protonemata) -- green, branched filaments produced on germination of spores and giving rise to a leafy or thallose gametophyte.

Pseudoelaters -- small, 2-5 celled, sterile structures mixed with the spores in the capsules of hornworts; aiding in spore dispersal. (Fig. 129: 108)

Pseudopodium (p1. Pseudopodia) -- an elongation of a stem tip bearing clusters of gemmae. (Fig. 125: 66)

Pyriform -- pear-shaped. (Fig. 126: 81)

Reflexed -- bent backward. (Fig. 122: 31)
Retuse -- slightly indented at a broad apex. (Fig. 121: 9)
Rhizoids -- filamentous, unicellular (hornworts and liverworts) or multicellular (mosses) structures, dead at maturity, occurring on the gametophyte and anchoring it to the substratum. (Fig. 124: 58-59)

Rib -- a longitudinal ridge on capsules or other organs. (Fig. 127: 84)
Rosette -- circular (rose-like) arrangement of leaves. (Fig. 124: 59)
Rugose -- with irregular transverse wrinkles or undulations. (Fig. 122: 36)

Scales -- flat, blade-like, ventral appendages on gametophytes of thalloid liverworts. (Fig. 128: 99)

Secondary Stem -- branches arising from the main or primary stem.
Secund -- turned to one side.
Sessile -- without a stalk or seta.
Serrate -- saw-toothed, with marginal teeth pointing forward. (Fig. 123: 41)
Seta (p1. Setae) -- the stalk supporting the capsule. (Fig. 126: 73; 129: 113)
Sheathing -- surrounding and clasping the stem or base of the seta. (Fig. 122: 28)
Simple -- applied to structures, organs or plants that are unbranched.
Sinus -- the indentation between lobes of a leaf. (Fig. 129: 104)
Spinose -- spiny, with sharp, slender teeth or projections. (Fig. 123: 43)
Spinulose -- minutely spiny.
Spores -- minute, mostly spherical, nearly always unicellular bodies, produced in the capsule, that on germination form a gametophyte.

Sporophyte -- the spore-bearing generation; the spore-bearing plant, produced by the fertilization of an egg, remaining attached to the gametophyte and partially dependent on it, typically consisting of foot, seta and capsule. (Fig. 126: 73)

Spreading -- at an angle of $45^{\circ}$ or more. (Fig. 123: 45)
Squarrose -- spreading at right angles. (Fig. 123: 47)
Squarrose-Recurved -- spreading at right angles, with the tips curved downward. (Fig. 123: 48)

Stoloniferous -- plants that bear slender, creeping, usually minutely leaved stems and branches, often with rhizoids near the tips. (Fig. 125: 63)

Striate -- marked with fine, longitudinal ridges. (Fig. 127: 86)
Striolate -- finely ridged.
Struma -- a goiter-like swelling on one side of the base of a capsule of some mosses. (Fig. 127: 87)

Strumose -- bearing a struma. (Fig. 127: 87)
Sub- -- a prefix meaning nearly, almost, somewhat, as in subg1obose, subpercurrent, or subpinnate; also used to mean under, as subterranean.

Substratum -- the surface to which the plant is attached.
Subulate -- slenderly long-acuminate, shaped like a needle. (Fig. 121: 7)
Succubous -- leaves of liverworts that are obliquely inserted so the upper leaf overlaps the one below it when viewed from the dorsal surface and toward the stem apex. (Fig. 128: 102)

Sulcate - grooved or furrowed. (Fig. 127: 85)
Symmetric -- capable of division by one or more planes forming similar halves.

Terete -- rounded in cross-section, cylindric. (Fig. 124: 52)

Thalloid -- of, relating to, resembling or consisting of a thallus.
Thallus (pl. Thalli) -- a plant body that is flat, not much differentiated, and cordate or ribbon-like. (Fig. 128: 96)

Tomentose -- densely woolly, covered with rhizoids. (Fig. 125: 69)
Tooth -- a division of the peristome (Fig. 126: 74); also applied to irregularities or projections at the margins of leaves. (Fig. 123: 43)

Transverse -- leaves of liverworts that are inserted at right angles to the line of the stem. (Fig. 128: 103)

Tri- -- a prefix meaning thrice.
Tridentate -- with three dentations. (Fig. 129: 105)
Truncate -- abruptly cut off or squared off at the apex. (Fig. 121: 10)
Tubulose -- tube-like, usually referring to leaves with strongly incurved margins. (Fig. 122: 30)

Underleaves -- the leaves of the single row on the postical side of the stem of liverworts; amphigastria. (Fig. 128: 100)

Undulate -- wavy. (Fig. 122: 37)
Unicellular -- composed of one cell.
Unistratose -- composed of one layer.
Urn -- the spore bearing portion of a capsule. (Fig. 126: 73)

Valve -- one of the divisions into which the capsule of hornworts, most liverworts and the moss Andreaea separates when the spores are ready to be shed. (Fig. 127:92-94)

Ventral -- the front or upper surface (i.e., the surface toward the stem) of a leaf, or the lower surface (i.e., the surface toward the substratum) of a flattened plant body like a thallus. (Fig. 122: 26; 128: 99-100)

Ventral Lobe -- the lobe on the lower surface of the plant. (Fig. 129: 109)
Vitta -- a central band of one or more rows of glistening, elongated and thickened cells of certain liverworts, e.g., Diplophyllum. (Fig. 129: 111)

Wide-Spreading -- spreading at an angle but less than $90^{\circ}$. (Fig. 123: 46)

Xerophytic -- referring to a plant adapted to a dry habitat.
